# **Preface**

# **About This Book**

This book is intended to accompany my book *How To Prove It* (henceforth called *HTPI*), which is published by Cambridge University Press. Although this book is self-contained, we will sometimes have occasion to refer to passages in *HTPI*, so this book will be easiest to understand if you have a copy of *HTPI* available to you.

HTPI explains a systematic approach to constructing mathematical proofs. The purpose of this book is to show you how to use a computer software package called *Lean* to help you master the techniques presented in HTPI. Lean is free software that is available for Windows, MacOS, and Unix computers. To get the most out of this book, you will need to download and install Lean on your computer. We will explain how to do that below.

The chapters and sections of this book are numbered to match the sections of HTPI to which they correspond. The first two chapters of HTPI cover preliminary topics in elementary logic and set theory that are needed to understand the proof techniques presented in later chapters. We assume that you are already familiar with that material (if not, go read those chapters in HTPI!), so Chapters 1 and 2 of this book will just briefly summarize the most important points. Those chapters are followed by an introduction to Lean that explains the basics of using Lean to write proofs. The presentation of proof techniques in HTPI begins in earnest in Chapter 3, so that is where we will begin to discuss how Lean can be used to master those techniques.

If you are reading this book online, then you will find a search box in the left margin. You can use that box to search for any word or phrase anywhere in the book. Below the search box is a list of the chapters of the book. Click on any chapter to go to that chapter. Within each chapter, a table of contents in the right margin lists the sections in that chapter. Again, you can go to any section by clicking on it. At the end of each chapter there are links to take you to the next or previous chapter.

# **About Lean**

Lean is a kind of software package called a *proof assistant*. What that means is that Lean can help you to write proofs. As we will see over the course of this book, there are several ways

in which Lean can be helpful. First of all, if you type a proof into Lean, then Lean can check the correctness of the proof and point out errors. As you are typing a proof into Lean, it will keep track of what has been accomplished so far in the proof and what remains to be done to finish the proof, and it will display that information for you. That can keep you moving in the right direction as you are figuring out a proof. And sometimes Lean can fill in small details of the proof for you.

Of course, to make this possible you must type your proof in a format that Lean understands. Much of this book will be taken up with explaining how to write a proof so that Lean will understand it.

# **Installing Lean**

We will be using Visual Studio Code to run Lean, so you will need to install VS Code first. VS Code is free and can be downloaded here.

You will also need the Lean package that accompanies this book, which can be downloaded from <a href="https://github.com/djvelleman/HTPILeanPackage">https://github.com/djvelleman/HTPILeanPackage</a>. After following the link, click on the green "Code" button and, in the pop-up menu, select "Download ZIP". Open the downloaded zip file to create a folder containing the HTPI Lean package. You can put this folder wherever you want on your computer.

Now open VS Code. You should see a window that looks something like this:

Click on the *Extensions* icon on the left side of the window, which is circled in red in the image above. That will bring up a list of available extensions:

In the Search Extensions in Marketplace field, type "lean4". VS Code should find the Lean 4 extension and display it:

Click on "Install" to install the Lean 4 extension.

Next, in VS Code, select "Open Folder …" from the File menu and open the folder containing the HTPI Lean package that you downloaded earlier. Under the heading "Explorer" on the left side of the window, you should see a list of the files in the package. (If you don't see the list, try clicking on the *Explorer* icon, circled in red below.)

Click on the file "Blank.lean" in the file list. You should see a warning that VS Code failed to start the 'lean' language server:

Click on the "Install Lean using Elan" button, and the Lean server should be installed. This may take a while, and there may be messages asking you to do things. If anything goes wrong, try quiting VS Code and restarting. Eventually your window should look like this:

If you don't see the Infoview pane on the right side of the window, click on the icon circled in red in the image above, and the Infoview pane should appear.

Your installation is now complete.

# 1 Sentential Logic

Chapter 1 of How To Prove It introduces the following symbols of logic:

Symbol	Meaning	
	not	
$\wedge$	and	
$\vee$	or	
$\rightarrow$	if then	
$\leftrightarrow$	if and only if	

As we will see, Lean uses the same symbols, with the same meanings. This chapter also establishes a number of logical equivalences that will be useful to us later:

Name		Equivalence	
De Morgan's Laws	$\neg (P \land Q)$	is equivalent to	$\neg P \lor \neg Q$
	$\neg (P \lor Q)$	is equivalent to	$\neg P \land \neg Q$
Double Negation Law	$\neg \neg P$	is equivalent to	P
Conditional Laws	P  o Q	is equivalent to	$\neg P \vee Q$
	P  o Q	is equivalent to	$\neg (P \land \neg Q)$
Contrapositive Law	$P \to Q$	is equivalent to	$\neg Q \rightarrow \neg P$

Finally, Chapter 1 of HTPI introduces some concepts from set theory. A set is a collection of objects; the objects in the collection are called elements of the set. If P(x) is a statement about x, then  $\{x \mid P(x)\}$  denotes the set whose elements are the objects x for which P(x) is true. The notation  $x \in A$  means that x is an element of A. Two sets A and B are equal if they have exactly the same elements. We say that A is a subset of B, denoted  $A \subseteq B$ , if every element of A is an element of B. And we have the following operations on sets:

$$A \cap B = \{x \mid x \in A \land x \in B\} = \text{ the } intersection \text{ of } A \text{ and } B,$$
 
$$A \cup B = \{x \mid x \in A \lor x \in B\} = \text{ the } union \text{ of } A \text{ and } B,$$
 
$$A \setminus B = \{x \mid x \in A \land x \notin B\} = \text{ the } difference \text{ of } A \text{ and } B,$$
 
$$A \triangle B = (A \setminus B) \cup (B \setminus A) = \text{ the } symmetric \text{ } difference \text{ of } A \text{ and } B.$$

# 2 Quantificational Logic

Chapter 2 of How To Prove It introduces two more symbols of logic, the quantifiers  $\forall$  and  $\exists$ . If P(x) is a statement about an object x, then

$$\forall x P(x)$$
 means "for all  $x, P(x)$ ,"

and

 $\exists x P(x)$  means "there exists some x such that P(x)."

Lean also uses these symbols, although we will see that quantified statements are written slightly differently in Lean from the way they are written in HTPI. In the statement P(x), the variable x is called a *free variable*. But in  $\forall x P(x)$  or  $\exists x P(x)$ , it is a *bound variable*; we say that the quantifiers  $\forall$  and  $\exists$  *bind* the variable.

Once again, there are logical equivalences involving these symbols that will be useful to us later:

Name	Equivalence		
Quantifier Negation Laws	$\neg \exists x  P(x) \\ \neg \forall x  P(x)$	is equivalent to is equivalent to	

Chapter 2 of HTPI also introduces some more advanced set theory operations. For any set A,

$$\mathscr{P}(A) = \{X \mid X \subseteq A\} = \text{ the power set of } A.$$

Also, if  $\mathcal{F}$  is a family of sets—that is, a set whose elements are sets—then

$$\bigcap \mathcal{F} = \{x \mid \forall A (A \in \mathcal{F} \rightarrow x \in A)\} = \text{ the } intersection \text{ of the family } \mathcal{F},$$

$$\bigcup \mathcal{F} = \{x \mid \exists A (A \in \mathcal{F} \land x \in A)\} = \text{ the } \textit{union of the family } \mathcal{F}.$$

Finally, Chapter 2 introduces the notation  $\exists !x \, P(x)$  to mean "there is exactly one x such that P(x)." This can be thought of as an abbreviation for  $\exists x (P(x) \land \neg \exists y (P(y) \land y \neq x))$ . By the quantifier negation, De Morgan, and conditional laws, this is equivalent to  $\exists x (P(x) \land \forall y (P(y) \rightarrow y = x))$ .

# Introduction to Lean

If you are reading this book in conjunction with *How To Prove It*, you should complete Section 3.2 of *HTPI* before reading this chapter. Once you have reached that point in *HTPI*, you are ready to start learning about Lean. In this chapter we'll explain the basics of writing proofs in Lean and getting feedback from Lean.

# A First Example

We'll start with Example 3.2.4 in *How To Prove It*. Here is how the theorem and proof in that example appear in *HTPI* (consult *HTPI* if you want to see how this proof was constructed):

```
Theorem. Suppose P \to (Q \to R). Then \neg R \to (P \to \neg Q).
```

*Proof.* Suppose  $\neg R$ . Suppose P. Since P and  $P \to (Q \to R)$ , it follows that  $Q \to R$ . But then, since  $\neg R$ , we can conclude  $\neg Q$ . Thus,  $P \to \neg Q$ . Therefore  $\neg R \to (P \to \neg Q)$ .

And here is how we would write the proof in Lean:

```
theorem Example_3_2_4  (P \ Q \ R : Prop) \ (h : P \rightarrow (Q \rightarrow R)) : \neg R \rightarrow (P \rightarrow \neg Q) := by  assume h2 : \neg R assume h3 : P have h4 : Q \rightarrow R := h h3 contrapos at h4 --Now h4 : \neg R \rightarrow \neg Q show \neg Q from h4 h2
```

Let's go through this Lean proof line-by-line and see what it means. The first line tells Lean that we are going to prove a theorem, and it gives the theorem a name, Example\_3\_2\_4. The next line states the theorem. In the theorem as stated in HTPI, the letters P, Q, and R are used to stand for statements that are either true or false. In logic, such statements are often called *propositions*. The expression (P Q R : Prop) on the second line tells Lean that P, Q, and R will be used in this theorem to stand for propositions. The next parenthetical expression, (h : P  $\rightarrow$  (Q  $\rightarrow$  R)), states the hypothesis of the theorem and gives it the name h; the technical term that Lean uses is that h is an *identifier* for the hypothesis. Assigning an identifier to the

hypothesis gives us a way to refer to it when it is used later in the proof. Almost any string of characters that doesn't begin with a digit can be used as an identifier, but it is traditional to use identifiers beginning with the letter h for hypotheses. After the statement of the hypothesis there is a colon followed by the conclusion of the theorem,  $\neg R \rightarrow (P \rightarrow \neg Q)$ . Finally, at the end of the second line, the expression := by signals the beginning of the proof.

Each of the remaining lines is a step in the proof. The first line of the proof introduces the assumption  $\neg R$  and gives it the identifier h2. Of course, this corresponds precisely to the first sentence of the proof in HTPI. Similarly, the second line, corresponding to the second sentence of the HTPI proof, assigns the identifier h3 to the assumption P. The next line makes the inference  $Q \rightarrow R$ , giving it the identifier h4. The inference is justified by combining statements h and h3—that is, the statements  $P \rightarrow (Q \rightarrow R)$  and P—exactly as in the third sentence of the proof in HTPI.

The next step of the proof in HTPI combines the statements  $Q \to R$  and  $\neg R$  to draw the inference  $\neg Q$ . This reasoning is justified by the contrapositive law, which says that  $Q \to R$  is equivalent to its contrapositive,  $\neg R \to \neg Q$ . In the Lean proof, this inference is broken up into two steps. In the fourth line of the proof, we ask Lean to rewrite statement h4—that is,  $Q \to R$ —using the contrapositive law. Two hyphens in a row tell Lean that the rest of the line is a comment. Lean ignores comments and displays them in green. The comment on line four serves as a reminder that h4 now stands for the statement  $\neg R \to \neg Q$ . Finally, in the last line of the proof, we combine the new h4 with h2 to infer  $\neg Q$ . There is no need to give this statement an identifier, because it completes the proof. In the proof in HTPI, there are a couple of final sentences explaining why this completes the proof, but Lean doesn't require this explanation.

# Term Mode

Now that you have seen an example of a proof in Lean, it is time for you to write your first proof. Lean has two modes for writing proofs, called *term mode* and *tactic mode*. The example above was written in tactic mode, and that is the mode we will use for most proofs in this book. But before we study the construction of proofs in tactic mode, it will be helpful to learn a bit about term mode. Term mode is best for simple proofs, so we begin with a few very short proofs.

If you have not yet installed Lean on your computer, go back and follow the instructions for installing it now. Then in VS Code, open the folder for the HTPI Lean Package that you downloaded and click on the file Blank.lean. The file starts with the line import HTPIDefs. Click on the blank line at the end of the file; this is where you will be typing your first proofs.

Now type in the following theorem and proof:

```
theorem extremely_easy (P : Prop) (h : P) : P := h
```

This theorem and proof are so short we have put everything on one line. In this theorem, the letter P is used to stand for a proposition. The theorem has one hypothesis, P, which has been given the identifier h, and the conclusion of the theorem is also P. The notation := indicates that what follows will be a proof in term mode.

Of course, the proof of the theorem is extremely easy: to prove P, we just have to point out that it is given as the hypothesis h. And so the proof in Lean consists of just one letter: h.

Even though this example is a triviality, there are some things to be learned from it. First of all, although we have been describing the letter h as an *identifier* for the hypothesis P, this example illustrates that Lean also considers h to be a *proof* of P. In general, when we see h: P in a Lean proof, where P is a proposition, we can think of it as meaning, not just that h is an identifier for the statement P, but also that h is a proof of P.

We can learn something else from this example by changing it slightly. If you change the final h to a different letter—say, f—you will see that Lean puts a red squiggly line under the f, like this:

```
theorem extremely_easy (P : Prop) (h : P) : P := f
```

This indicates that Lean has detected an error in the proof. Lean always indicates errors by putting a red squiggle under the offending text. Lean also puts a message in the Lean Infoview pane explaining what the error is. (If you don't see the Infoview pane, choose "Command Palette …" in the "View" menu, and then type "Lean" in the text box that appears. You will see a list of commands that start with "Lean". Click on "Lean 4: Infoview: Toggle" to make the Infoview pane appear.) In this case, the message is unknown identifier 'f'. The message is introduced by a heading, in red, that identifies the file, the line number, and the character position on that line where the error appears. If you change f back to h, the red squiggle and error message go away.

Let's try a slightly less trivial example. To type the  $\rightarrow$  symbol in the next example, type \to and then hit either the space bar or the tab key; when you type either space or tab, the \to will change to  $\rightarrow$ . Alternatively, you can type \r (short for "right arrow") or \imp (short for "implies"), again followed by either space or tab. Or, you can type ->, and Lean will interpret it as  $\rightarrow$ .

```
theorem very_easy (P Q : Prop) (h1 : P \rightarrow Q) (h2 : P) : Q := h1 h2
```

This time there are two hypotheses,  $h1:P\to Q$  and h2:P. As explained in Section 3.2 of HTPI, the conclusion Q follows from these hypotheses by the logical rule *modus ponens*. To use modus ponens to complete this proof in term mode, we simply write the identifiers of

the two hypotheses—which, as we have just seen, can also be thought of as proofs of the two hypotheses—one after the other, with a space between them. It is important to write the proof of the conditional hypothesis first, so the proof is written  $h1\ h2$ ; if you try writing this proof as  $h2\ h1$ , you will get a red squiggle. In general, if a is a proof of any conditional statement  $X \to Y$ , and b is a proof of the antecedent X, then a b is a proof of the consequent Y. The proofs a and b need not be simply identifiers; any proofs of a conditional statement and its antecedent can be combined in this way.

We'll try one more proof in term mode:

```
theorem easy (P Q R : Prop) (h1 : P \rightarrow Q) (h2 : Q \rightarrow R) (h3 : P) : R :=
```

Note that in the statement of the theorem, you can break the lines however you please; this time we have put the declaration of P, Q, and R and the first hypothesis on the first line and the other two hypotheses on the second line. How can we prove the conclusion R? Well, we have  $h2:Q\to R$ , so if we could prove Q then we could use modus ponens to reach the desired conclusion. In other words,  $h2\_$  will be a proof of R, if we can fill in the blank with a proof of Q. Can we prove Q? Yes, Q follows from  $P\to Q$  and P by modus ponens, so P has a proof of P and P by modus ponens, so P has a proof of P and P by modus ponens, so P has a proof of P and P by modus ponens, so P has a proof of P and P by modus ponens, so P has a proof of P by P has a proof of P by P by modus ponens, so P has a proof of P by P by modus ponens, so P has a proof of P by P by modus ponens, so P has a proof of P by P by modus ponens, so P has a proof of P by P by modus ponens, so P has a proof of P by P by modus ponens, so P has a proof of P by P by modus ponens, so P has a proof of P by P by modus ponens, so P has a proof of P by P by modus ponens, so P has a proof of P by P by modus ponens, so P has a proof of P by P by modus ponens, so P has a proof of P by modus ponens, so P has a proof of P by modus ponens, so P has a proof of P by modus ponens, so P has a proof of P by modus ponens, so P has a proof of P by modus ponens, so P has a proof of P by modus ponens, so P has a proof of P by modus ponens, so P has a proof of P ha

# **Tactic Mode**

For more complicated proofs, it is easier to use tactic mode. Type the following theorem into Lean; to type the symbol ¬, type \not, followed again by either space or tab. Alternatively, if you type Not P, Lean will interpret it as meaning ¬P.

```
theorem two_imp (P Q R : Prop)

(h1 : P \rightarrow Q) (h2 : Q \rightarrow \negR) : R \rightarrow \negP :=
```

Lean is now waiting for you to type a proof in term mode. To switch to tactic mode, type by after :=. Although it is not necessary, we find it helpful to set off a tactic proof from the surrounding text by indenting it, and also by marking where the proof ends. To do this, leave a blank line after the statement of the theorem and begin the next line with a tab; VS Code will indent two spaces. Then type done. You will type your proof between the statement of the theorem and the line containing done, so click on the blank line between them to position the cursor there.

One of the advantages of tactic mode is that Lean displays, in the Lean Infoview pane, information about the status of the proof as your write it. As soon as you position your cursor on

the blank line, Lean displays what it calls the "tactic state" in the Infoview pane. Your screen should look like this:

#### Lean File

#### Tactic State in Infoview

```
theorem two_imp (P Q R : Prop) 

(h1 : P \rightarrow Q) (h2 : Q \rightarrow \negR) : R \rightarrow \negP := by 

h1 : P \rightarrow Q 

h2 : Q \rightarrow \negR 

to R \rightarrow \negP
```

The red squiggle under done indicates that Lean knows that the proof isn't done. The tactic state in the Infoview pane is very similar to the lists of givens and goals that are used in HTPI. The tactic state above says that P, Q, and R stand for propositions, and we have two givens,  $h1: P \rightarrow Q$  and  $h2: Q \rightarrow \neg R$ . The symbol  $\vdash$  in the last line labels the goal,  $R \rightarrow \neg P$ . The tactic state is a valuable tool for guiding you as you are figuring out a proof.

From the hypotheses h1 and h2 it shouldn't be hard to prove  $P \to \neg R$ , but the goal is  $R \to \neg P$ . This suggests that we should prove the contrapositive of the goal. Type tab to indent two spaces and then contrapos to tell Lean that you want to replace the goal with its contrapositive. (You won't have to type tab to indent later lines; VS Code maintains the same indenting until you delete the tab at the beginning of a line to return to unindented text.) As soon as you type contrapos, Lean will update the tactic state to reflect the change in the goal. You should now see this:

## Lean File

## Tactic State in Infoview

```
theorem two_imp (P Q R : Prop)

(h1 : P \rightarrow Q) (h2 : Q \rightarrow ¬R) : R \rightarrow ¬P := by

contrapos

done

P Q R : Prop

h1 : P \rightarrow Q

h2 : Q \rightarrow ¬R

\vdash P \rightarrow ¬R
```

If you want to make your proof a little more readable, you could add a comment saying that the goal has been changed to  $P \rightarrow \neg R$ . To prove the new goal, we will assume P and prove  $\neg R$ . So type assume h3:P on a new line (after contrapos, but before done). Once again, the tactic state is immediately updated. Lean adds the new given h3:P, and it knows, without having to be told, that the goal should now be  $\neg R$ :

#### Lean File

#### Tactic State in Infoview

```
theorem two_imp (P Q R : Prop)

(h1 : P \rightarrow Q) (h2 : Q \rightarrow ¬R) : R \rightarrow ¬P := by

contrapos

--Goal is now P \rightarrow ¬R

assume h3 : P

done

P Q R : Prop

h1 : P \rightarrow Q

h2 : Q \rightarrow ¬R

h3 : P

\leftarrow ¬R
```

We can now use modus ponens to infer Q from  $h1:P\to Q$  and h3:P. As we saw earlier, this means that h1:h3 is a term-mode proof of Q. So on the next line, type have h4:Q:=h1:h3. To make an inference, you need to provide a justification, so := here is followed by the term-mode proof of Q. Usually we will use have to make easy inferences for which we can give simple term-mode proofs. (We'll see later that it is also possible to use have to make an inference justified by a tactic-mode proof.) Of course, Lean updates the tactic state by adding the new given h4:Q:

# Lean File

# Tactic State in Infoview

Finally, to complete the proof, we can infer the goal  $\neg R$  from  $h2:Q \rightarrow \neg R$  and h4:Q, using the term-mode proof h2:h4. Type  $show \neg R$  from h2:h4 to complete the proof. You'll notice two changes in the display: the red squiggle will disappear from the word done, and the tactic state will say "Goals accomplished":

#### Lean File

#### Tactic State in Infoview

Congratulations! You've written your first proof in tactic mode. If you move your cursor around in the proof, you will see that Lean always displays in the Infoview the tactic state at the point in the proof where the cursor is located. Try clicking on different lines of the proof to see how the tactic state changes over the course of the proof. If you want to try another example, you could try typing in the first example in this chapter.

We have now seen four tactics: contrapos, assume, have, and show. If the goal is a conditional statement, the contrapos tactic replaces it with its contrapositive. If h is a given that is a conditional statement, then contrapos at h will replace h with its contrapositive. If the goal is a conditional statement  $P \rightarrow Q$ , you can use the assume tactic to assume the antecedent P, and Lean will set the goal to be the consequent Q. You can use the have tactic to make an inference from your givens, as long as you can justify the inference with a proof. The show tactic is

similar, but it is used to infer the goal, thus completing the proof. And we have learned how to use one rule of inference in term mode: modus ponens. In the rest of this book we will learn about other tactics and other term-mode rules.

Before continuing, it might be useful to summarize how you type statements into Lean. We have already told you how to type the symbols  $\rightarrow$  and  $\neg$ , but you will want to know how to type all of the logical connectives. In each case, the command to produce the symbol must be followed by space or tab, but there is also a plain text alternative:

Symbol	How To Type It	Plain Text Alternative
7	\not or \n	Not
٨	\and	/\
٧	\or or \v	\/
$\rightarrow$	<pre>\to or \r or \imp</pre>	->
$\leftrightarrow$	\iff or \lr	<->

Lean has conventions that it follows to interpret a logical statement when there are not enough parentheses to indicate how terms are grouped in the statement. For our purposes, the most important of these conventions is that  $P \to Q \to R$  is interpreted as  $P \to (Q \to R)$ , not  $(P \to Q) \to R$ . The reason for this is simply that statements of the form  $P \to (Q \to R)$  come up much more often in proofs than statements of the form  $(P \to Q) \to R$ . (Lean also follows this "grouping-to-the-right" convention for  $\Lambda$  and V, although this makes less of a difference, since these connectives are associative.) Of course, when in doubt about how to type a statement, you can always put in extra parentheses to avoid confusion.

We will be using tactics to apply several logical equivalences. Here are tactics corresponding to all of the logical laws listed in Chapter 1:

Logical Law	Tactic		Transformation	
Contrapositive Law	contrapos	P → Q	is changed to	¬Q → ¬P
De Morgan's Laws	demorgan	¬(P ∧ Q)	is changed to	¬P v ¬Q
		¬(P v Q)	is changed to	¬P ∧ ¬Q
		PΛQ	is changed to	¬(¬P v ¬Q)
		ΡvQ	is changed to	¬(¬P ∧ ¬Q)
Conditional Laws	conditional	$P \rightarrow Q$	is changed to	¬P v Q
		$\neg(P \rightarrow Q)$	is changed to	P∧¬Q
		ΡvQ	is changed to	$\neg P \rightarrow Q$
		PΛQ	is changed to	$\neg(P \rightarrow \neg Q)$
Double Negation Law	double_neg	¬¬P	is changed to	Р

All of these tactics work the same way as the contrapos tactic: by default, the transformation is applied to the goal; to apply it to a given h, add at h after the tactic name.

# **Types**

All of our examples so far have just used letters to stand for propositions. To prove theorems with mathematical content, we will need to introduce one more idea.

The underlying theory on which Lean is based is called *type theory*. We won't go very deeply into type theory, but we will need to make use of the central idea of the theory: every variable in Lean must have a type. What this means is that, when you introduce a variable to stand for a mathematical object in a theorem or proof, you must specify what type of object the variable stands for. We have already seen this idea in action: in our first example, the expression (PQR: Prop) told Lean that the variables P, Q, and R have type Prop, which means they stand for propositions. There are types for many kinds of mathematical objects. For example, Nat is the type of natural numbers, and Real is the type of real numbers. So if you want to state a theorem about real numbers x and y, the statement of your theorem might start with (x y: Real). You must include such a type declaration before you can use the variables x and y as free variables in the hypotheses or conclusion of your theorem.

What about sets? If you want to prove a theorem about a set A, can you say that A has type Set? No, Lean is fussier than that. Lean wants to know, not only that A is a set, but also what the type of the elements of A is. So you can say that A has type Set Nat if A is a set whose elements are natural numbers, or Set Real if it is a set of real numbers, or even Set (Set Nat) if it is a set whose elements are sets of natural numbers. Here is an example of a simple theorem about sets; it is a simplified version of Example 3.2.5 in HTPI. To type the symbols  $\epsilon$ ,  $\notin$ , and  $\setminus$  in this theorem, type  $\setminus$  in,  $\setminus$  notin, and  $\setminus$ , respectively.

```
Lean File Tactic State in Infoview
```

```
theorem Example_3_2_5_simple
(B C : Set Nat) (a : Nat)
(h1 : a ∈ B) (h2 : a ∉ B \ C) : a ∈ C := by

h1 : a ∈ B
h2 : ¬a ∈ B \ C

done

done
```

The second line of this theorem statement declares that the variables B and C stand for sets of natural numbers, and a stands for a natural number. The third line states the two hypotheses of the theorem,  $a \in B$  and  $a \notin B \setminus C$ , and the conclusion,  $a \in C$ .

To figure out this proof, we'll imitate the reasoning in Example 3.2.5 in *HTPI*. We begin by writing out the meaning of the given h2. Fortunately, we have a tactic for that. The tactic define writes out the definition of the goal, and as usual we can add at to apply the tactic to a given rather than the goal. Here's the situation after using the tactic define at h2:

#### Tactic State in Infoview

Looking at the tactic state, we see that Lean has written out the meaning of set difference in h2. And now we can see that, as in Example 3.2.5 in HTPI, we can put h2 into a more useful form by applying first one of De Morgan's laws to rewrite it as  $\neg a \in B \lor a \in C$  and then a conditional law to change it to  $a \in B \to a \in C$ :

#### Lean File

### Tactic State in Infoview

```
theorem Example_3_2_5_simple (B C : Set Nat) (a : Nat) (h1 : a \in B) (h2 : a \notin B \setminus C) : a \in C := by (h1 : a \in B) (h2 : a \notin B \setminus C) : a \in C := by (h1 : a \in B) (h2 : a \in B \setminus C) (h2 : a \in B \rightarrow C) (h2 : a \in B \rightarrow C) (h2 : a \in B \rightarrow C) (h2 : a \in C \cap C) (h2 : a \in C \cap C) (h3 : a \in C \cap C) (h3 : a \in C \cap C) (h4 : a \in C \cap C) (h5 : a \in C \cap C) (h6 : a \in C \cap C) (h7 : a \in C \cap C) (h8 : a \in C \cap C) (h9 : a \in C \cap C) (h9 : a \in C \cap C) (h1 : a \in C \cap C) (h2 : a \in C \cap C \cap C) (h2 : a \in C \cap C \cap C) (h2 : a \in C \cap C \cap C) (h2 : a \in C \cap C \cap C) (h2 : a \in C \cap C \cap C) (h2 : a \in C \cap C \cap C) (h2 : a \in C \cap C \cap C) (h2 : a \in C \cap C \cap C) (h3 : a \in C \cap C \cap C) (h3 : a \in C \cap C \cap C) (h3 : a \in C \cap C \cap C) (h3 : a \in C \cap C \cap C) (h3 : a \in C \cap C \cap C) (h4 : a \in C \cap C \cap C) (h5 : a \in C \cap C \cap C) (h6 : a \in C \cap C \cap C) (h6 : a \in C \cap C \cap C) (h7 : a \in C \cap C \cap C) (h8 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h1 : a \in C \cap C \cap C) (h1 : a \in C \cap C \cap C) (h1 : a \in C \cap C \cap C) (h2 : a \in C \cap C \cap C) (h1 : a \in C \cap C \cap C) (h2 : a \in C \cap C \cap C) (h2 : a \in C \cap C \cap C) (h3 : a \in C \cap C \cap C) (h1 : a \in C \cap C \cap C) (h2 : a \in C \cap C \cap C) (h3 : a \in C \cap C \cap C) (h3 : a \in C \cap C \cap C) (h4 : a \in C \cap C \cap C) (h5 : a \in C \cap C \cap C) (h6 : a \in C \cap C \cap C) (h6 : a \in C \cap C \cap C) (h7 : a \in C \cap C \cap C) (h7 : a \in C \cap C \cap C) (h8 : a \in C \cap C \cap C) (h8 : a \in C \cap C \cap C) (h8 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C) (h9 : a \in C \cap C \cap C
```

Occasionally, you may feel that the application of two tactics one after the other should be thought of as a single step. To allow for this, Lean lets you put two tactics on the same line, separated by a semicolon. For example, in this proof you could write the use of De Morgan's law and the conditional law as a single step by writing demorgan at h2; conditional at h2. Now the rest is easy: we can apply modus ponens to reach the goal:

#### Lean File

#### Tactic State in Infoview

```
Goals accomplished 🎉
```

There is one unfortunate feature of this theorem: We have stated it as a theorem about sets of natural numbers, but the proof has nothing to do with natural numbers. Exactly the same reasoning would prove a similar theorem about sets of real numbers, or sets of objects of any

other type. Do we need to write a different theorem for each of these cases? No, fortunately there is a way to write one theorem that covers all the cases:

```
theorem Example_3_2_5_simple_general
(U : Type) (B C : Set U) (a : U)
(h1 : a ∈ B) (h2 : a ∉ B \ C) : a ∈ C := by
```

In this version of the theorem, we have introduced a new variable U, whose type is ... Type! So U can stand for any type. You can think of the variable U as playing the role of the universe of discourse, an idea that was introduced in Section 1.3 of *HTPI*. The sets B and C contain elements from that universe of discourse, and a belongs to the universe. You can prove the new version of the theorem by using exactly the same sequence of tactics as before.

# 3 Proofs

# 3.1 & 3.2. Proofs Involving Negations and Conditionals

Sections 3.1 and 3.2 of *How To Prove It* present strategies for dealing with givens and goals involving negations and conditionals. We restate those strategies here, and explain how to use them with Lean.

Section 3.1 gives two strategies for proving a goal of the form  $P \rightarrow Q$ :

# To prove a goal of the form $P \rightarrow Q$ :

- 1. Assume P is true and prove Q.
- 2. Assume Q is false and prove that P is false.

We've already seen how to carry out both of these strategies in Lean. For the first strategy, use the assume tactic to introduce the assumption P and assign an identifier to it; Lean will automaticall set Q as the goal. We can summarize the effect of using this strategy by showing how the tactic state changes if you use the tactic assume h: P:

Tactic State Before Using Strategy

Tactic State After Using Strategy

$$\vdots \\ \vdash P \rightarrow Q$$
 
$$\vdots \\ h : P \\ \vdash Q$$

The second strategy is justified by the contrapositive law. In Lean, you can use the contrapos tactic to rewrite the goal as  $\neg Q \rightarrow \neg P$  and then use the tactic assume  $h : \neg Q$ . The net effect of these two tactics is:

Tactic State Before Using Strategy

Tactic State After Using Strategy

Section 3.2 gives two strategies for using givens of the form  $P \rightarrow Q$ , with the second once again being a variation on the first based on the contrapositive law:

## To use a given of the form $P \rightarrow Q$ :

- 1. If you are also given P, or you can prove that P is true, then you can use this given to conclude that Q is true.
- 2. If you are also given  $\neg Q$ , or you can prove that Q is false, then you can use this given to conclude that P is false.

The first strategy is the modus ponens rule of inference, and we saw in the last chapter that if you have  $h1:P\to Q$  and h2:P, then h1:h2 is a (term-mode) proof of Q; often we use this rule with the have or show tactic. For the second strategy, if you have  $h1:P\to Q$  and  $h2:\neg Q$ , then the contrapos at h1 tactic will change h1 to  $h1:\neg Q\to \neg P$ , and then h1:h2 will be a proof of  $\neg P$ .

All of the strategies listed above for working with conditional statements as givens or goals were illustrated in examples in the last chapter.

Section 3.2 of HTPI offers two strategies for proving negative goals:

# To prove a goal of the form ¬P:

- 1. Reexpress the goal in some other form.
- 2. Use proof by contradiction: assume P is true and try to deduce a contradiction.

For the first strategy, the tactics demorgan, conditional, and double\_neg may be useful, and we saw how those tactics work in the last chapter. But how do you write a proof by contradiction in Lean? The answer is to use a tactic called by\_contra. If the goal is ¬P, then the tactic by\_contra h will introduce the assumption h: P and set the goal to be False, like this:

Tactic State Before Using Strategy

Tactic State After Using Strategy

In Lean, False represents a statement that is always false—that is, a contradiction, as that term is defined in Section 1.2 of HTPI. The by\_contra tactic can actually be used even if the goal is not a negative statement. If the goal is a statement P that is not a negative statement, then by\_contra h will initiate a proof by contradiction by introducing the assumption h: ¬P and setting the goal to be False.

You will usually complete a proof by contradiction by deducing two contradictory statements—say, h1: Q and h2: ¬Q. But how do you convince Lean that the proof is over? You must be able to prove the goal False from the two givens h1 and h2. There are two ways to do this. The first is based on the fact that Lean treats a statement of the form ¬Q as meaning the same

thing as  $Q \rightarrow False$ . This makes sense, because these statements are logically equivalent, as shown by the following truth table:

Q	¬Q	(Q	→	False)
F	Τ	F	Τ	F
Τ	F	Τ	F	$\mathbf{F}$

Thinking of  $h2 : \neg Q$  as meaning  $h2 : Q \rightarrow False$ , we can combine it with h1 : Q using modus ponens to deduce False. In other words, h2 h1 is a proof of False.

But there is a second way of completing the proof that it is worthwhile to know about. From contradictory statements h1:Q and  $h2:\neg Q$  you can validly deduce any statement. This follows from the definition of a valid argument in Section 1.1 of HTPI. According to that definition, you can validly infer a conclusion R from premises h1:Q and  $h2:\neg Q$  if the premises cannot both be true without the conclusion also being true. In this case, that standard is met, for the simple reason that the premises cannot both be true! (This gives part of the answer to exercise 18 in Section 1.2 of HTPI.) Thus, Lean has a rule that allows you to prove any statement from contradictory premises. If you have h1:Q and  $h2:\neg Q$ , then Lean will recognize absurd h1:Q as a (term-mode) proof of any statement.

To summarize, if you have h1: Q and h2: ¬Q, then there are two ways to prove False. Lean will recognize h2 h1 as a proof of False, and it will recognize absurd h1 h2 as a proof of any statement, including False. Notice the difference in the order in which h1 and h2 are listed in these two proofs: In the first one, the negative statement h2 must come first, just as the conditional statement must come first in an application of modus ponens. But in a proof using absurd, the negative statement must come second.

To illustrate proof by contradiction in Lean, let's redo our first example from the last Chapter in a different way. That example was based on Example 3.2.4 in *HTPI*. We'll begin with the same first two steps, introducing two assumptions. (We won't bother to include the done line in the displays below.)

#### Lean File

```
theorem Example_3_2_4_v2 (P Q R : Prop) 
 (h : P \rightarrow (Q \rightarrow R)) : \neg R \rightarrow (P \rightarrow \neg Q) := by 
 assume h2 : \neg R 
 assume h3 : P
```

#### Tactic State in Infoview

```
P Q R : Prop
h : P → Q → R
h2 : ¬R
h3 : P
⊢ ¬Q
```

Now the goal is a negative statement, so we use the tactic by\_contra h4 to introduce the assumption h4 : Q and set the goal to be False:

# Tactic State in Infoview

```
theorem Example_3_2_4_v2 (P Q R : Prop) 

(h : P \rightarrow (Q \rightarrow R)) : \negR \rightarrow (P \rightarrow \negQ) := by 

assume h2 : \negR 

assume h3 : P 

by_contra h4 

P Q R : Prop 

h : P \rightarrow Q \rightarrow R 

h2 : \negR 

h3 : P 

h4 : Q 

\vdash False
```

Using the givens h, h3, and h4 we can deduce first  $Q \rightarrow R$  and then R by two applications of modus ponens:

# Lean File

# Tactic State in Infoview

```
theorem Example_3_2_4_v2 (P Q R : Prop) 

(h : P \rightarrow (Q \rightarrow R)) : \negR \rightarrow (P \rightarrow \negQ) := by 

assume h2 : \negR 

assume h3 : P 

by_contra h4 

have h5 : Q \rightarrow R := h h3 

have h6 : R := h5 h4 

P Q R : Prop 

h : P \rightarrow Q \rightarrow R 

h2 : \negR 

h3 : P 

h4 : Q 

h5 : Q \rightarrow R 

h6 : R 

\vdash False
```

Now we have a contradiction:  $h2: \neg R$  and h6: R. To complete the proof, we deduce False from these two givens. Either h2 h6 or absurd h6 h2 would be accepted by Lean as a proof of False:

# Lean File

# Tactic State in Infoview

Goals accomplished 🎉

```
theorem Example_3_2_4_v2 (P Q R : Prop)
(h : P \rightarrow (Q \rightarrow R)) : \neg R \rightarrow (P \rightarrow \neg Q) := by
assume h2 : \neg R
assume h3 : P
by\_contra h4
have h5 : Q \rightarrow R := h h3
have h6 : R := h5 h4
show False from h2 h6
```

Finally, we have two strategies for using a given that is a negative statement:

#### To use a given of the form $\neg P$ :

1. Reexpress the given in some other form.

2. If you are doing a proof by contradiction, you can achieve a contradiction by proving P, since that would contradict the given ¬P.

Of course, strategy 1 suggests the use of the demorgan, conditional, and double\_neg tactics, if they apply. For strategy 2, if you are doing a proof by contradiction and you have a given h: ¬P, then the tactic contradict h will set the goal to be P, which will complete the proof by contradicting h. In fact, this tactic can be used with any given; if you have a given h: P, where P is not a negative statement, then contradict h will set the goal to be ¬P. If you're not doing a proof by contradiction, then the tactic contradict h with h' will first initiate a proof by contradiction by assuming the negation of the goal, giving that assumption the identifier h', and then it will set the goal to be the negation of h. In other words, contradict h with h' is shorthand for by\_contra h'; contradict h.

We can illustrate this with yet another way to write the proof from Example 3.2.4. Our first three steps will be the same as last time:

# Lean File

```
theorem Example_3_2_4_v3 (P Q R : Prop) 

(h : P \rightarrow (Q \rightarrow R)) : \negR \rightarrow (P \rightarrow \negQ) := by 

assume h2 : \negR 

assume h3 : P 

by_contra h4 

P Q R : Prop 

h : P \rightarrow Q \rightarrow R 

h2 : \negR 

h3 : P 

h4 : Q 

False
```

Since we are now doing a proof by contradiction and the given  $h2: \neg R$  is a negative statement, a likely way to proceed is to try to prove R, which would contradict h2. So we use the tactic contradict h2:

# Lean File

```
theorem Example_3_2_4_v3 (P Q R : Prop) 
(h : P \rightarrow (Q \rightarrow R)) : \negR \rightarrow (P \rightarrow \negQ) := by assume h2 : \negR assume h3 : P by_contra h4 contradict h2
```

# Tactic State in Infoview

Tactic State in Infoview

```
P Q R : Prop
h : P → Q → R
h2 : ¬R
h3 : P
h4 : Q
⊢ R
```

As before, we can now prove R by combining h, h3, and h4. In fact, we could do it in one step: by modus ponens, h h3 is a proof of  $Q \rightarrow R$ , and therefore, by another application of modus ponens, (h h3) h4 is a proof of R. The parentheses here are not necessary; Lean will interpret h h3 h4 as (h h3) h4, so we can complete the proof like this:

#### Tactic State in Infoview

```
theorem Example_3_2_4_v3 (P Q R : Prop)
(h : P \rightarrow (Q \rightarrow R)) : \neg R \rightarrow (P \rightarrow \neg Q) := by
assume h2 : \neg R
assume h3 : P
by\_contra h4
contradict h2
show R from h h3 h4
```

Goals accomplished 🎉

You could shorten this proof slightly by replacing the lines by\_contra h4 and contradict h2 with the single line contradict h2 with h4.

There is one more idea that is introduced in Section 3.2 of *HTPI*. The last example in that section illustrates how you can sometimes use rules of inference to work backwards. Here's a similar example in Lean:

#### Lean File

```
theorem Like_Example_3_2_5 (U : Type) (A B C : Set U) (a : U) (h1 : a \in A) (h2 : a \notin A \setminus B) (h3 : a \in B \rightarrow a \in C) : a \in C := by
```

#### Tactic State in Infoview

```
U : Type
A B C : Set U
a : U
h1 : a ∈ A
h2 : ¬a ∈ A \ B
h3 : a ∈ B → a ∈ C
⊢ a ∈ C
```

The goal is  $a \in C$ , and the only given that even mentions C is  $h3 : a \in B \rightarrow a \in C$ . If only we could prove  $a \in B$ , then we could apply h3, using modus ponens, to reach our goal. So it would make sense to work toward the goal of proving  $a \in B$ .

To get Lean to use this proof strategy, we use the tactic apply h3 .. The underscore here represents a blank to be filled in by Lean. You might think of this tactic as asking Lean the question: If we want h3 \_ to be a proof of the goal  $a \in C$ , what do we have to put in the blank? Lean is able to figure out that the answer is: a proof of  $a \in B$ . So it sets the goal to be  $a \in B$ , since a proof of that goal, when inserted into the blank in h3 \_, would prove the original goal  $a \in C$ :

```
Tactic State in Infoview
```

```
theorem Like_Example_3_2_5
(U : Type) (A B C : Set U) (a : U)
(h1 : a ∈ A) (h2 : a ∉ A \ B)
(h3 : a ∈ B → a ∈ C) : a ∈ C := by
apply h3 _
```

```
U : Type

A B C: Set U

a : U

h1 : a ∈ A

h2 : ¬a ∈ A \ B

h3 : a ∈ B → a ∈ C

⊢ a ∈ B
```

It may not be clear what to do next, but the given h2 is a negative statement, so perhaps reexpressing it will help. Writing out the definition of set difference, h2 means  $\neg(a \in A \land a \notin B)$ , and then one of De Morgan's laws and a conditional law allow us to rewrite it first as  $(a \notin A \lor a \in B)$  and then as  $(a \in A \to a \in B)$ . Of course, we have tactics to accomplish all of these reexpressions:

Lean File

```
Tactic State in Infoview
```

```
theorem Like_Example_3_2_5
(U : Type) (A B C : Set U) (a : U)
(h1 : a ∈ A) (h2 : a ∉ A \ B)
(h3 : a ∈ B → a ∈ C) : a ∈ C := by
   apply h3 _
   define at h2
   demorgan at h2; conditional at h2
```

```
U : Type
A B C : Set U
a : U
h1 : a ∈ A
h2 : a ∈ A → a ∈ B
h3 : a ∈ B → a ∈ C
⊢ a ∈ B
```

And now it is easy to complete the proof by applying modus ponens, using h2 and h1:

Lean File

```
Tactic State in Infoview
```

```
theorem Like_Example_3_2_5
(U: Type) (A B C: Set U) (a: U)
(h1: a ∈ A) (h2: a ∉ A \ B)
(h3: a ∈ B → a ∈ C): a ∈ C:= by
apply h3 _
define at h2
demorgan at h2; conditional at h2
show a ∈ B from h2 h1
```

Goals accomplished 🎉

We will see many more uses of the apply tactic later in this book.

Sections 3.1 and 3.2 of *HTPI* contain several proofs that involve algebraic reasoning. Although one can do such proofs in Lean, it requires ideas that we are not ready to introduce yet. So for the moment we will stick to proofs involving only logic and set theory.

# 3.3. Proofs Involving Quantifiers

In the notation used in HTPI, if P(x) is a statement about x, then  $\forall x P(x)$  means "for all x, P(x)," and  $\exists x P(x)$  means "there exists at least one x such that P(x)." The letter P here does not stand for a proposition; it is only when it is applied to some object x that we get a proposition. We will say that P is a *predicate*, and when we apply P to an object x we get a proposition P(x). You might want to think of the predicate P as representing some property that an object might have, and the proposition P(x) asserts that x has that property.

To use a predicate in Lean, you must tell Lean the type of objects to which it applies. If U is a type, then  $Pred\ U$  is the type of predicates that apply to objects of type U. If P has type  $Pred\ U$  (that is, P is a predicate applying to objects of type U) and X has type U, then to apply P to X we just write P X (with a space but no parentheses). Thus, if we have P:  $Pred\ U$  and X: U, then P X is an expression of type Prop. That is, P X is a proposition, and its meaning is that X has the property represented by the predicate P.

There are a few differences between the way quantified statements are written in HTPI and the way they are written in Lean. First of all, when we apply a quantifier to a variable in Lean we will specify the type of the variable explicitly. Also, Lean requires that after specifying the variable and its type, you must put a comma before the proposition to which the quantifier is applied. Thus, if P has type Pred U, then to say that P holds for all objects of type U we would write  $\forall$  (x : U), P x. Similarly,  $\exists$  (x : U), P x is the proposition asserting that there exists at least one x of type U such that P x.

And there is one more important difference between the way quantified statements are written in HTPI and Lean. In HTPI, a quantifier is interpreted as applying to as little as possible. Thus,  $\forall x\, P(x) \land Q(x)$  is interpreted as  $(\forall x\, P(x)) \land Q(x)$ ; if you want the quantifier  $\forall x$  to apply to the entire statement  $P(x) \land Q(x)$  you must use parentheses and write  $\forall x(P(x) \land Q(x))$ . The convention in Lean is exactly the opposite: a quantifier applies to as much as possible. Thus, Lean will interpret  $\forall$  (x : U), P x  $\land$  Q x as meaning  $\forall$  (x : U), (P x  $\land$  Q x). If you want the quantifier to apply to only P x, then you must use parentheses and write ( $\forall$  (x : U), P x)  $\land$  Q x.

With this preparation, we are ready to consider how to write proofs involving quantifiers in Lean. The most common way to prove a goal of the form  $\forall$  (x : U), P x is to use the following strategy:

# To prove a goal of the form $\forall (x : U), P x$ :

Let x stand for an arbitrary object of type U and prove P x. If the letter x is already being used in the proof to stand for something, then you must choose an unused variable, say y, to stand for the arbitrary object, and prove P y.

To do this in Lean, you should use the tactic fix x : U, which tells Lean to treat x as standing for some fixed but arbitrary object of type U. This has the following effect on the tactic state:

Tactic State Before Using Strategy

Tactic State After Using Strategy

To use a given of the form  $\forall$  (x : U), P x, we usually apply a rule of inference called *universal* instantiation, which is described by the following proof strategy:

# To use a given of the form $\forall$ (x : U), P x:

You may plug in any value of type U, say a, for x and use this given to conclude that P a is true.

This strategy says that if you have  $h: \forall (x:U)$ ,  $P \times A$  and A : U, then you can infer  $P \times A$ . Indeed, in this situation Lean will recognize A : A = A as a proof of A : A. For example, you can write A : A : A as A : A and A : A as A : A and A : A and

Let's try these strategies out in a Lean proof. In Lean, if you don't want to give a theorem a name, you can simply call it an example rather than a theorem, and then there is no need to give it a name. In the following theorem, you can enter the symbol  $\forall$  by typing \forall or \all, and you can enter  $\exists$  by typing \exists or \ex.

#### Lean File

```
example (U : Type) (P Q : Pred U)

(h1 : \forall (x : U), P x \rightarrow \negQ x)

(h2 : \forall (x : U), Q x) :

\neg∃ (x : U), P x := by
```

#### Tactic State in Infoview

```
U : Type
P Q : Pred U
h1 : ∀ (x : U), P x → ¬Q x
h2 : ∀ (x : U), Q x
⊢ ¬∃ x, P x
```

(In the tactic state, why doesn't Lean show the type of the variable x after the existential quantifier in the goal? I don't know. Sometimes you can leave out the type of a quantified variable and Lean is able to figure it out on its own. But sometimes Lean is unable to figure out the type if it is not supplied, and you will get an error message if you leave it out. To avoid confusion, we will always include the type of the quantified variable when we enter a quantified statement into Lean, but you will notice that Lean generally leaves out the type when it displays existentially quantified statements in the tactic state.)

To use the givens h1 and h2, we will probably want to use universal instantiation. But to do that we would need an object of type U to plug in for x in h1 and h2, and there is no object of

type U in the tactic state. So at this point, we can't apply universal instantiation to h1 and h2. We should watch for an object of type U to come up in the course of the proof, and consider applying universal instantiation if one does. Until then, we turn our attention to the goal.

The goal is a negative statement, so we begin by reexpressing it as an equivalent positive statement, using a quantifier negation law. The tactic quant\_neg applies a quantifier negation law to rewrite the goal. As with the other tactics for applying logical equivalences, you can write quant\_neg at h if you want to apply a quantifier negation law to a given h. The effect of the tactic can be summarized as follows:

	quant_neg Tactic	
¬∀ (x : U), P x	is changed to	∃ (x : U), ¬P x
¬∃ (x : U), P x	is changed to	∀ (x : U), ¬P x
∀ (x : U), P x	is changed to	¬∃ (x : U), ¬P x
∃ (x : U), P x	is changed to	¬∀ (x : U), ¬P x

Using the quant\_neg tactic leads to the following result.

# Lean File

# Tactic State in Infoview

```
U : Type
P Q : Pred U
h1 : ∀ (x : U), P x → ¬Q x
h2 : ∀ (x : U), Q x
⊢ ∀ (x : U), ¬P x
```

Now the goal starts with  $\forall$ , so we use the strategy above and introduce an arbitrary object of type U. Since the variable x occurs as a bound variable in several statements in this theorem, it might be best to use a different letter for the arbitrary object; this isn't absolutely necessary, but it may help to avoid confusion. So our next tactic is fix y:U.

# Lean File

```
example (U : Type) (P Q : Pred U)
(h1 : ∀ (x : U), P x → ¬Q x)
(h2 : ∀ (x : U), Q x) :
¬∃ (x : U), P x := by
quant_neg --Goal is now ∀ (x : U), ¬P x
fix y : U
```

# Tactic State in Infoview

```
U : Type
P Q : Pred U
h1 : ∀ (x : U), P x → ¬Q x
h2 : ∀ (x : U), Q x
y : U
⊢ ¬P y
```

Now we have an object of type U in the tactic state, namely, y. So let's try applying universal instantiation to h1 and h2 and see if it helps.

## Tactic State in Infoview

```
example (U : Type) (P Q : Pred U)
                                                                 U: Type
(h1 : \forall (x : U), P x \rightarrow \neg Q x)
                                                                 P Q: Pred U
                                                                 h1 : \forall (x : U), P x \rightarrow \neg Q x
(h2 : \forall (x : U), Q x) :
\neg \exists (x : U), P x := by
                                                                 h2: \forall (x: U), Qx
  y : U
                                                                 h3: P y \rightarrow \neg Q y
  fix y : U
  have h3 : P y \rightarrow \neg Q y := h1 y
                                                                 h4: Q y
                                                                 ⊢ ¬P y
  have h4 : Q y := h2 y
```

We're almost done, because the goal now follows easily from h3 and h4. If we use the contrapositive law to rewrite h3 as Q  $y \rightarrow \neg P$  y, then we can apply modus ponens to the rewritten h3 and h4 to reach the goal:

# Lean File

### Tactic State in Infoview

```
Goals accomplished 🎉
```

```
example (U : Type) (P Q : Pred U)

(h1 : ∀ (x : U), P x → ¬Q x)

(h2 : ∀ (x : U), Q x) :

¬∃ (x : U), P x := by

quant_neg     --Goal is now ∀ (x : U), ¬P x

fix y : U

have h3 : P y → ¬Q y := h1 y

have h4 : Q y := h2 y

contrapos at h3 --Now h3 : Q y → ¬P y

show ¬P y from h3 h4
```

Our next example is a theorem of set theory. You already know how to type a few set theory symbols in Lean, but you'll need a few more for our next example. Here's a summary of the most important set theory symbols and how to type them in Lean.

Symbol	How To Type It
€	\in
∉	\notin or \inn
⊆	\sub
⊈	\subn
U	\union or \cup
Λ	\inter or \cap
\	\\
Δ	\bigtriangleup
P	\powerset

With this preparation, we can turn to our next example.

### Lean File

## Tactic State in Infoview

```
example (U : Type) (A B C : Set U) (h1 : A \subseteq B \cup C)

(h2 : \forall (x : U), x \in A \rightarrow x \notin B) : A \subseteq C := by

A B C : Set U
h1 : A \subseteq B \cup C
h2 : \forall (x : U),
x \in A \rightarrow \neg x \in B
\vdash A \subseteq C
```

We begin by using the define tactic to write out the definition of the goal.

# Lean File

## Tactic State in Infoview

Notice that Lean's definition of the goal starts with  $\forall$  {a : U}, not  $\forall$  (a : U). Why did Lean use curly braces rather than parentheses? We'll return to that question shortly. The difference doesn't affect our next steps, which are to introduce an arbitrary object y of type U and assume  $y \in A$ .

#### Lean File

#### Tactic State in Infoview

```
example (U : Type) (A B C : Set U) (h1 : A \subseteq B \cup C)

(h2 : \forall (x : U), x \in A \rightarrow x \notin B) : A \subseteq C := by

define --Goal: \forall {a : U}, a \in A \rightarrow a \in C

fix y : U

assume h3 : y \in A

\begin{array}{c}
U : Type \\
A B C : Set U \\
h1 : A \subseteq B \cup C \\
h2 : \forall (x : U), \\
x \in A \rightarrow \neg x \in B \\
y : U \\
h3 : y \in A \\
\vdash y \in C
\end{array}
```

Now we can combine h2 and h3 to conclude that  $\neg y \in B$ . Since we have y : U, by universal instantiation, h2 y is a proof of  $y \in A \rightarrow \neg y \in B$ , and therefore by modus ponens, h2 y h3 is a proof of  $\neg y \in B$ .

#### Tactic State in Infoview

We should be able to use similar reasoning to combine h1 and h3, if we first write out the definition of h1.

### Lean File

```
example (U : Type) (A B C : Set U) (h1 : A \subseteq B \cup C) (h2 : \forall (x : U), x \in A \rightarrow x \notin B) : A \subseteq C := by define --Goal: \forall {a : U}, a \in A \rightarrow a \in C fix y : U assume h3 : y \in A have h4 : y \notin B := h2 y h3 define at h1 --h1 : \forall {a : U}, a \in U \rightarrow a \in B \cup C
```

# Tactic State in Infoview

```
U: Type

A B C: Set U

h1: ∀ {a: U},

a ∈ A → a ∈ B ∪ C

h2: ∀ (x: U),

x ∈ A → ¬x ∈ B

y: U

h3: y ∈ A

h4: ¬y ∈ B

⊢ y ∈ C
```

Once again, Lean has used curly braces to define h1, and now we are ready to explain what they mean. If the definition had been  $h1: \forall (a: \cup), a \in A \rightarrow a \in B \cup C$ , then exactly as in the previous step, h1 y h3 would be a proof of  $y \in B \cup C$ . The use of curly braces in the definition  $h1: \forall \{a: \cup\}, a \in A \rightarrow a \in B \cup C$  means that you don't need to tell Lean that y is being plugged in for a in the universal instantiation step; Lean will figure that out on its own. Thus, you can just write h1 h3 as a proof of  $y \in B \cup C$ . Indeed, if you write h1 y h3 then you will get an error message, because Lean expects not to be told what to plug in for a. You might think of the definition of h1 as meaning  $h1: \_ \in A \rightarrow \_ \in B \cup C$ , where the blanks can be filled in with anything of type U (with the same thing being put in both blanks). When you ask Lean to apply modus ponens by combining this statement with  $h3: y \in A$ , Lean figures out that in order for modus ponens to apply, the blanks must be filled in with y.

In this situation, the a in h1 is called an *implicit argument*. What this means is that, when h1 is applied to make an inference in a proof, the value to be assigned to a is not specified explicitly; rather, the value is implicit. We will see many more examples of implicit arguments later in this book.

#### Tactic State in Infoview

```
example (U : Type) (A B C : Set U) (h1 : A \subseteq B \cup C) (h2 : \forall (x : U), x \in A \rightarrow x \notin B) : A \subseteq C := by define --Goal: \forall {a : U}, a \in A \rightarrow a \in C fix y : U assume h3 : y \in A have h4 : y \notin B := h2 y h3 define at h1 --h1 : \forall {a : U}, a \in U \rightarrow a \in B \cup C have h5 : y \in B \cup C := h1 h3
```

```
U: Type

A B C: Set U

h1: ∀ {a: U},

a ∈ A → a ∈ B ∪ C

h2: ∀ (x: U),

x ∈ A → ¬x ∈ B

y: U

h3: y ∈ A

h4: ¬y ∈ B

h5: y ∈ B ∪ C

⊢ y ∈ C
```

If Lean was able to figure out that y should be plugged in for a in h1 in this step, couldn't it have figured out that y should be plugged in for x in h2 in the previous have step? The answer is yes. Of course, in h2, x was not an implicit argument, so Lean wouldn't automatically figure out what to plug in for x. But we could have asked it to figure it out by writing the proof in the previous step as  $h2 _ b3$  rather than  $h2 _ yb3$ . In a term-mode proof, an underscore represents a blank to be filled in by Lean. Try changing the earlier step of the proof to have  $h4 : y \notin B := h2 _ b3$  and you will see that Lean will accept it. Of course, in this case this doesn't save us any typing, but in some situations it is useful to let Lean figure out some part of a proof.

Lean's ability to fill in blanks in term-mode proofs is limited. For example, if you try changing the previous step to have  $h4:y\notin B:=h2y$ , you'll get a red squiggle under the blank, and the error message in the Infoview pane will say don't know how to synthesize placeholder. In other words, Lean was unable to figure out how to fill in the blank in this case. In future proofs you might try replacing some expressions with blanks to get a feel for what Lean can and cannot figure out for itself.

Continuing with the proof, we see that we're almost done, because we can combine h4 and h5 to reach our goal. To see how, we first write out the definition of h5.

```
Tactic State in Infoview
```

```
example (U : Type) (A B C : Set U) (h1 : A \subseteq B \cup C) (h2 : \forall (x : U), x \in A \rightarrow x \notin B) : A \subseteq C := by define --Goal: \forall {a : U}, a \in A \rightarrow a \in C h1 fix y : U assume h3 : y \in A have h4 : y \notin B := h2 y h3 x define at h1 --h1 : \forall {a : U}, a \in U \rightarrow a \in B \cup C y : have h5 : y \in B \cup C := h1 h3 define at h5 --h5 : y \in B \vee y \in C
```

```
U: Type

A B C: Set U

h1: ∀ {a: U},

a ∈ A → a ∈ B ∪ C

h2: ∀ (x: U),

x ∈ A → ¬x ∈ B

y: U

h3: y ∈ A

h4: ¬y ∈ B

h5: y ∈ B ∨ y ∈ C

⊢ y ∈ C
```

A conditional law will convert h5 to  $\neg y \in B \rightarrow y \in C$ , and then modus ponens with h4 will complete the proof.

#### Lean File

#### Tactic State in Infoview

```
example (U: Type) (A B C: Set U) (h1: A \subseteq B \cup C) (h2: \forall (x: U), x \in A \rightarrow x \notin B): A \subseteq C:= by define --Goal: \forall {a: U}, a \in A \rightarrow a \in C fix y: U assume h3: y \in A have h4: y \notin B:= h2 y h3 define at h1 --h1: \forall {a: U}, a \in U \rightarrow a \in B \cup C have h5: y \in B \cup C:= h1 h3 define at h5 --h5: \negy \in B \vee y \in C show y \in C from h5 h4
```

Next we turn to strategies for working with existential quantifiers.

# To prove a goal of the form $\exists (x : U), P x$ :

Find a value of x, say a, for which you think P a is true, and prove P a.

This strategy is based on the fact that if you have a:U and h:P a, then you can infer  $\exists$  (x:U), P x. Indeed, in this situation the expression Exists.intro a h is a Lean term-mode proof of  $\exists$  (x:U), P x. The name Exists.intro indicates that this is a rule for introducing an existential quantifier.

As suggested by the strategy above, we will often want to use this rule in situations in which our goal is  $\exists$  (x : U), P x and we have an object a of type U that we think makes P a true, but

we don't yet have a proof of P a. In that situation we can use the tactic apply Exists.intro a \_. Recall that the apply tactic asks Lean to figure out what to put in the blank to turn Exists.intro a \_ into a proof of the goal. Lean will figure out that what needs to go in the blank is a proof of P a, so it sets P a to be the goal. In other words, the tactic apply Exists.intro a \_ has the following effect on the tactic state:

Tactic State Before Using Strategy

Tactic State After Using Strategy

```
:
a: U
⊢∃ (x: U), P x
⊢ P a
```

Our strategy for using an existential given is a rule that is called *existential instantiation* in *HTPI*:

## To use a given of the form $\exists (x : U), P x$ :

Introduce a new variable, say a, into the proof to stand for an object of type U for which P a is true.

Suppose that, in a Lean proof, you have  $h:\exists (x:U), P x$ . To apply the existential instantiation rule, you would use the tactic obtain (a:U) (h':Pa) from h. This tactic introduces into the tactic state both a new variable a of type U and also the identifier h' for the new given P a.

Often, if your goal is an existential statement  $\exists$  (x : U), P x, you won't be able to use the strategy above for existential goals right away, because you won't know what object a to use in the tactic apply Exists.intro a \_. You may have to wait until a likely candidate for a pops up in the course of the proof. On the other hand, it is usually best to use the obtain tactic right away if you have an existential given. This is illustrated in our next example.

#### Lean File

```
example (U : Type) (P Q : Pred U)

(h1 : \forall (x : U), \exists (y : U), P \times \neg \neg Q y)

(h2 : \exists (x : U), \forall (y : U), P \times \rightarrow Q y) :

\exists (x : U), \neg P \times \neg Q = 0
```

#### Tactic State in Infoview

```
U : Type
P Q : Pred U
h1 : ∀ (x : U), ∃ y,
P x → ¬Q y
h2 : ∃ x, ∀ (y : U),
P x → Q y
⊢ ∃ x, ¬P x
```

The goal is the existential statement  $\exists$  (x : U),  $\neg P$  x, and our strategy for existential goals says that we should try to find an object a of type U that we think would make the statement  $\neg P$  a true. But we don't have any objects of type U in the tactic state, so it looks like we can't

use that strategy yet. Similarly, we can't use the given h1 yet, since we have nothing to plug in for x in h1. However, h2 is an existential given, and we can use it right away.

#### Lean File

```
example (U : Type) (P Q : Pred U)
(h1 : ∀ (x : U), ∃ (y : U), P x → ¬ Q y)
(h2 : ∃ (x : U), ∀ (y : U), P x → Q y) :
∃ (x : U), ¬P x := by
obtain (a : U)
    (h3 : ∀ (y : U), P a → Q y) from h2
```

#### Tactic State in Infoview

```
U: Type
PQ: Pred U
h1: ∀(x:U), ∃y,
Px→¬Qy
h2:∃x, ∀(y:U),
Px→Qy
a:U
h3:∀(y:U), Pa→Qy
⊢∃x,¬Px
```

Now that we have a : U, we can apply universal instantiation to h1, plugging in a for x.

#### Lean File

```
example (U : Type) (P Q : Pred U)

(h1 : ∀ (x : U), ∃ (y : U), P x → ¬ Q y)

(h2 : ∃ (x : U), ∀ (y : U), P x → Q y) :

∃ (x : U), ¬P x := by

obtain (a : U)

(h3 : ∀ (y : U), P a → Q y) from h2

have h4 : ∃ (y : U), P a → ¬ Q y := h1 a
```

## Tactic State in Infoview

```
U: Type
PQ: Pred U
h1: ∀ (x: U), ∃ y,
Px → ¬Q y
h2: ∃ x, ∀ (y: U),
Px → Q y
a: U
h3: ∀ (y: U), Pa → Q y
h4: ∃ y, Pa → ¬Q y
⊢ ∃ x, ¬P x
```

By the way, this is another case in which Lean could have figured out a part of the proof on its own. Try changing h1 a in the last step to h1 \_, and you'll see that Lean will be able to figure out how to fill in the blank.

Our new given h4 is another existential statement, so again we use it right away to introduce another object of type U. Since this object might not be the same as a, we must give it a different name. (Indeed, if you try to use the name a again, Lean will give you an error message.)

```
example (U : Type) (P Q : Pred U)
(h1 : ∀ (x : U), ∃ (y : U), P x → ¬ Q y)
(h2 : ∃ (x : U), ∀ (y : U), P x → Q y) :
∃ (x : U), ¬P x := by
obtain (a : U)
    (h3 : ∀ (y : U), P a → Q y) from h2
have h4 : ∃ (y : U), P a → ¬ Q y := h1 a
obtain (b : U) (h5 : P a → ¬ Q b) from h4
```

#### Tactic State in Infoview

```
U: Type
PQ: Pred U
h1: ∀ (x: U), ∃ y,
Px → ¬Q y
h2: ∃ x, ∀ (y: U),
Px → Q y
a: U
h3: ∀ (y: U), Pa → Q y
h4: ∃ y, Pa → ¬Q y
b: U
h5: Pa → ¬Q b
⊢ ∃ x, ¬P x
```

We have not yet used h3. We could plug in either a or b for y in h3, but a little thought should show you that plugging in b is more useful.

## Lean File

```
example (U: Type) (P Q: Pred U)
(h1: ∀ (x: U), ∃ (y: U), P x → ¬ Q y)
(h2:∃ (x: U), ∀ (y: U), P x → Q y):
∃ (x: U), ¬P x:= by
obtain (a: U)
(h3: ∀ (y: U), P a → Q y) from h2
have h4:∃ (y: U), P a → ¬ Q y:= h1 a
obtain (b: U) (h5: P a → ¬ Q b) from h4
have h6: P a → Q b:= h3 b
```

## Tactic State in Infoview

```
U: Type
PQ: Pred U
h1: ∀ (x: U), ∃ y,
Px → ¬Q y
h2:∃x, ∀ (y: U),
Px → Q y
a: U
h3: ∀ (y: U), Pa → Q y
h4:∃y, Pa → ¬Q y
b: U
h5: Pa → ¬Q b
h6: Pa → Q b
⊢∃x, ¬P x
```

Now look at h5 and h6. They show that P a leads to contradictory conclusions,  $\neg Q$  b and Q b. This means that P a must be false. We finally know what value of x to use to prove the goal.

```
example (U : Type) (P Q : Pred U)
(h1 : ∀ (x : U), ∃ (y : U), P x → ¬ Q y)
(h2 : ∃ (x : U), ∀ (y : U), P x → Q y) :
∃ (x : U), ¬P x := by
obtain (a : U)
    (h3 : ∀ (y : U), P a → Q y) from h2
have h4 : ∃ (y : U), P a → ¬ Q y := h1 a
obtain (b : U) (h5 : P a → ¬ Q b) from h4
have h6 : P a → Q b := h3 b
apply Exists.intro a _
```

#### Tactic State in Infoview

```
U: Type
PQ: Pred U
h1: ∀(x:U), ∃y,
Px→¬Qy
h2:∃x,∀(y:U),
Px→Qy
a:U
h3:∀(y:U), Pa→Qy
h4:∃y, Pa→¬Qy
b:U
h5: Pa→¬Qb
h6: Pa→Qb
⊢¬Pa
```

Since the goal is now a negative statement that cannot be reexpressed as a positive statement, we use proof by contradiction.

## Lean File

```
example (U : Type) (P Q : Pred U)

(h1 : ∀ (x : U), ∃ (y : U), P x → ¬ Q y)

(h2 : ∃ (x : U), ∀ (y : U), P x → Q y) :

∃ (x : U), ¬P x := by

obtain (a : U)

(h3 : ∀ (y : U), P a → Q y) from h2

have h4 : ∃ (y : U), P a → ¬ Q y := h1 a

obtain (b : U) (h5 : P a → ¬ Q b) from h4

have h6 : P a → Q b := h3 b

apply Exists.intro a _

by_contra h7
```

## Tactic State in Infoview

```
U: Type
PQ: Pred U
h1: ∀(x: U), ∃y,
Px → ¬Qy
h2: ∃x, ∀(y: U),
Px → Qy
a: U
h3: ∀(y: U), Pa → Qy
h4: ∃y, Pa → ¬Qy
b: U
h5: Pa → ¬Qb
h6: Pa → Qb
h7: Pa
⊢ False
```

Now h5 h7 is a proof of  $\neg Q$  b and h6 h7 is a proof of Q b, so (h5 h7) (h6 h7) is a proof of False.

## Tactic State in Infoview

```
example (U : Type) (P Q : Pred U)

(h1 : ∀ (x : U), ∃ (y : U), P x → ¬ Q y)

(h2 : ∃ (x : U), ∀ (y : U), P x → Q y) :

∃ (x : U), ¬P x := by

obtain (a : U)

(h3 : ∀ (y : U), P a → Q y) from h2

have h4 : ∃ (y : U), P a → ¬ Q y := h1 a

obtain (b : U) (h5 : P a → ¬ Q b) from h4

have h6 : P a → Q b := h3 b

apply Exists.intro a _

by_contra h7

show False from (h5 h7) (h6 h7)
```

Goals accomplished 🎉

We conclude this section with the theorem from Example 3.3.5 in HTPI. That theorem concerns a union of a family of sets. In HTPI, such a union is written using a large union symbol,  $\bigcup$ . Lean uses the symbol  $\cup_0$ , which is entered by typing  $\setminus \cup_0$  (that is, backslash-capital U-zero). For an intersection of a family of sets, Lean uses  $\cap_0$ , typed as  $\setminus I_0$ .

#### Lean File

## Tactic State in Infoview

```
theorem Example_3_3_5 (U : Type) (B : Set U)  (F : Set (Set U)) : U_0F \subseteq B \to F \subseteq \mathscr{P} B := by   B : Set U   F : Set (Set U)   \vdash U_0F \subseteq B \to F \subseteq \mathscr{P} B
```

Note that F has type Set (Set U), which means that it is a set whose elements are sets of objects of type U. Since the goal is a conditional statement, we assume the antecedent and set the consequent as our goal. We'll also write out the definition of the new goal.

## Lean File

```
Tactic State in Infoview
```

```
theorem Example_3_3_5 (U : Type) (B : Set U) 

(F : Set (Set U)) : U_0F \subseteq B \to F \subseteq \mathscr{P} B := by 

assume h1 : U_0F \subseteq B 

define 

U : Type 

B : Set U 

F : Set (Set U) 

h1 : U_0F \subseteq B 

\vdash \forall \{a : Set U\}, 

a \in F \to a \in \mathscr{P} B
```

Based on the form of the goal, we introduce an arbitrary object x of type  $Set\ U$  and assume  $x \in F$ . The new goal will be  $x \in \mathcal{P}$  B. The define tactic works out that this means  $x \subseteq B$ , which can be further expanded to  $\forall \{a : U\}, a \in x \rightarrow a \in B$ .

```
theorem Example_3_3_5 (U : Type) (B : Set U) (F : Set (Set U)) : U_0F \subseteq B \rightarrow F \subseteq \mathscr{P} B := by assume h1 : U_0F \subseteq B define fix x : Set U assume h2 : x \in F define
```

#### Tactic State in Infoview

```
U: Type
B: Set U
F: Set (Set U)
h1: U₀F ⊆ B
x: Set U
h2: x ∈ F
⊢ ∀ {a: U},
a ∈ x → a ∈ B
```

Once again the form of the goal dictates our next steps: introduce an arbitrary y of type U and assume  $y \in x$ .

## Lean File

```
theorem Example_3_3_5 (U : Type) (B : Set U) (F : Set (Set U)) : U_0F \subseteq B \rightarrow F \subseteq \mathscr{P} B := by assume h1 : U_0F \subseteq B define fix x : Set U assume h2 : x \in F define fix y : U assume h3 : y \in x
```

## Tactic State in Infoview

```
U: Type
B: Set U
F: Set (Set U)
h1: U₀F ⊆ B
x: Set U
h2: x ∈ F
y: U
h3: y ∈ x
⊢ y ∈ B
```

The goal can be analyzed no further, so we turn to the givens. We haven't used h1 yet. To see how to use it, we write out its definition.

## Lean File

```
theorem Example_3_3_5 (U : Type) (B : Set U) (F : Set (Set U)) : U_0F \subseteq B \rightarrow F \subseteq \mathscr{P} B := by assume h1 : U_0F \subseteq B define fix x : Set U assume h2 : x \in F define fix y : U assume h3 : y \in x define at h1
```

## Tactic State in Infoview

```
U: Type
B: Set U
F: Set (Set U)
h1: ∀ {a: U},
    a ∈ U₀F → a ∈ B
x: Set U
h2: x ∈ F
y: U
h3: y ∈ x
⊢ y ∈ B
```

Now we see that we can try to use h1 to reach our goal. Indeed, h1 \_ would be a proof of the goal if we could fill in the blank with a proof of  $y \in U_0F$ . So we use the apply h1 \_ tactic.

```
theorem Example_3_3_5 (U : Type) (B : Set U)
                                                                      U: Type
                                                                      B: Set U
(F : Set (Set U)) : U_0F \subseteq B \rightarrow F \subseteq \mathscr{P} B := by
                                                                      F : Set (Set U)
  assume h1 : U₀F ⊆ B
                                                                      h1: \forall \{a: U\},
  define
                                                                         a \in U_0F \rightarrow a \in B
  fix x : Set U
                                                                      x : Set U
  assume h2 : x \in F
                                                                      h2: x \in F
  define
  fix y : U
                                                                      y : U
                                                                      h3: y \in x
  assume h3 : y \in x
                                                                      \vdash y \in U_0F
  define at h1
  apply h1 _
```

Once again we have a goal that can be analyzed by using the define tactic.

## Tactic State in Infoview

Tactic State in Infoview

```
U: Type
theorem Example_3_3_5 (U : Type) (B : Set U)
                                                                     B: Set U
(F : Set (Set U)) : U_0F \subseteq B \rightarrow F \subseteq \mathscr{P} B := by
                                                                     F : Set (Set U)
  assume h1 : U_0F \subseteq B
                                                                     h1 : \forall \{a : U\},\
  define
  fix x : Set U
                                                                       a \in U_0F \to a \in B
                                                                     x : Set U
  assume h2 : x \in F
                                                                     h2: x \in F
  define
                                                                     y : U
 fix y : U
  assume h3 : y \in x
                                                                     h3: y \in x
                                                                     ⊢∃a, a ∈ F ∧ y ∈ a
  define at h1
  apply h1 _
  define
```

Our goal is now an existential statement, so we look for a value of a that will make the statement  $a \in F \land y \in a$  true. The givens h2 and h3 tell us that x is such a value, so as described earlier our next tactic should be apply Exists.intro x \_.

```
theorem Example_3_3_5 (U : Type) (B : Set U)
(F : Set (Set U)) : U₀F ⊆ B → F ⊆ 𝒯 B := by
   assume h1 : U₀F ⊆ B
   define
   fix x : Set U
   assume h2 : x ∈ F
   define
   fix y : U
   assume h3 : y ∈ x
   define at h1
   apply h1 _
   define
   apply Exists.intro x _
```

#### Tactic State in Infoview

```
U: Type
B: Set U
F: Set (Set U)
h1: ∀ {a: U},
    a ∈ U₀F → a ∈ B
x: Set U
h2: x ∈ F
y: U
h3: y ∈ x
⊢ x ∈ F ∧ y ∈ x
```

Clearly the goal now follows from h2 and h3, but how do we write the proof in Lean? Since we need to introduce the "and" symbol A, you shouldn't be surprised to learn that the rule we need is called And.intro. Proof strategies for statements involving "and" will be the subject of the next section.

#### Lean File

```

## Tactic State in Infoview

Goals accomplished 🎉

You might want to compare the Lean proof above to the way the proof was written in HTPI. Here are the theorem and proof from HTPI:

**Theorem.** Suppose B is a set and  $\mathcal{F}$  is a family of sets. If  $\bigcup \mathcal{F} \subseteq B$  then  $\mathcal{F} \subseteq \mathscr{P}(B)$ .

*Proof.* Suppose  $\bigcup \mathcal{F} \subseteq B$ . Let x be an arbitrary element of  $\mathcal{F}$ . Let y be an arbitrary element of x. Since  $y \in x$  and  $x \in \mathcal{F}$ , by the definition of  $\bigcup \mathcal{F}$ ,  $y \in \bigcup \mathcal{F}$ . But then since  $\bigcup \mathcal{F} \subseteq B$ ,  $y \in B$ . Since y was an arbitrary element of x, we can conclude that  $x \subseteq B$ , so  $x \in \mathcal{P}(B)$ . But x was an arbitrary element of  $\mathcal{F}$ , so this shows that  $\mathcal{F} \subseteq \mathcal{P}(B)$ , as required.  $\square$ 

# 3.4. Proofs Involving Conjunctions and Biconditionals

The strategies in HTPI for working with conjunctions are very simple.

## To prove a goal of the form P A Q:

Prove P and Q separately.

We already saw an example, at the end of the last section, of the use of the rule And.intro to prove a conjunction. In general, if you have h1:P and h2:Q, then And.intro h1 h2 is a proof of  $P \land Q$ . It follows that if your goal is  $P \land Q$  but you don't yet have proofs of P and Q, then you can use the tactic apply And.intro \_ \_. Lean will figure out that the blanks need to be filled in with proofs of P and Q, so it will ask you to prove P and Q separately, as suggested by the strategy above.

If you already have a proof of either P or Q, then you can fill in one of the blanks in the apply tactic. For example, if you have h: P, then you can write apply And.intro h\_, and Lean will tell you that you just have to prove Q to complete the proof. Similarly, if you have h: Q, then apply And.intro\_h will lead to just the single goal P. There is also a shortcut you can use with the apply tactic: any blanks that come at the end of the tactic can be left out. So instead of apply And.intro\_\_, you can just write apply And.intro, and instead of apply And.intro h\_, you can write apply And.intro h. On the other hand, apply And.intro\_h can't be shortened; it is only blanks at the end that can be left out.

The strategy for a given that is a conjunction is similar.

#### To use a given of the form $P \wedge Q$ :

Treat this as two separate givens: P, and Q.

If you have a given  $h : P \land Q$ , then Lean will recognize h.left as a proof of P, and h.right as a proof of Q.

Here's an example that illustrates these strategies. It is similar to Example 3.4.1 in HTPI

## Tactic State in Infoview

```
U : Type

A B C D : Set U

h1 : A ⊆ B

h2 : ¬∃ c, c ∈ C ∩ D

⊢ A ∩ C ⊆ B \ D
```

The define tactic will rewrite the goal as  $\forall$  {a : U}, a  $\in$  A  $\cap$  C  $\rightarrow$  a  $\in$  B  $\setminus$  D, and then we can introduce an arbitrary x : U and assume x  $\in$  A  $\cap$  C.

#### Lean File

```
theorem Like_Example_3_4_1 (U : Type)

(A B C D : Set U) (h1 : A ⊆ B)

(h2 : ¬∃ (c : U), c ∈ C ∩ D) : A ∩ C ⊆ B \ D := by

define

fix x : U

assume h3 : x ∈ A ∩ C
```

## Tactic State in Infoview

```
U : Type

A B C D : Set U

h1 : A ⊆ B

h2 : ¬∃ c, c ∈ C ∩ D

x : U

h3 : x ∈ A ∩ C

⊢ x ∈ B \ D
```

Now let's take a look at the definitions of h3 and the goal:

#### Lean File

```
theorem Like_Example_3_4_1 (U : Type)
(A B C D : Set U) (h1 : A ⊆ B)
(h2 : ¬∃ (c : U), c ∈ C ∩ D) : A ∩ C ⊆ B \ D := by
    define
    fix x : U
    assume h3 : x ∈ A ∩ C
    define at h3; define
```

## Tactic State in Infoview

```
U: Type

A B C D: Set U

h1: A ⊆ B

h2: ¬∃ c, c ∈ C ∩ D

x: U

h3: x ∈ A ∧ x ∈ C

⊢ x ∈ B ∧ ¬x ∈ D
```

Since the goal is now a conjuction, we use the strategy above by using the tactic apply And.intro.

Lean File Tactic State in Infoview

```
theorem Like_Example_3_4_1 (U : Type)
(A B C D : Set U) (h1 : A ⊆ B)
(h2 : ¬∃ (c : U), c ∈ C ∩ D) : A ∩ C ⊆ B \ D := by
  define
  fix x : U
  assume h3 : x ∈ A ∩ C
  define at h3; define
  apply And.intro
```

```
case left
U: Type
A B C D : Set U
h1 : A \subseteq B
h2: \neg \exists c, c \in C \cap D
x : U
h3: x \in A \land x \in C
\vdash x \in B
case right
U: Type
A B C D : Set U
h1 : A \subseteq B
h2: \neg\exists c, c \in C \cap D
x : U
h3: x \in A \land x \in C
\vdash \neg x \in D
```

Look carefully at the tactic state. Lean has listed two goals, one after the other, and it has helpfully labeled them "case left" and "case right," indicating that the first goal is proving the left side of the conjunction and the second is proving the right. The given information in both cases is the same, but in the first case the goal is  $x \in B$ , and in the second it is  $\neg x \in D$ . As we continue with the proof, Lean will interpret our tactics as applying to the first goal, until we achieve that goal. Once we achieve it, Lean will move on to the second goal. To make the proof more readable, we will add comments indicating which steps give the proof of the first goal and which prove the second.

The first goal is easy: We have  $h1:A\subseteq B$  and, as explained above,  $h3.left:x\in A$ . As we have seen in several previous examples, the tactic define at h1 will rewrite h1 as  $\forall$   $\{a:U\}$ ,  $a\in A\to a\in B$ , and then h1 h3.left will be a proof of  $x\in B$ . And now we'll let you in on a little secret: the define tactic isn't really necessary. You may find the define tactic to be useful in many situations, because it helps you see what a statement means. But Lean doesn't need to be told to work out what the statement means; it will do that automatically. So we can skip the define tactic and just give h1 h3.left as a proof of  $x\in B$ . In general, if you have  $h1:A\subseteq B$  and  $h2:x\in A$ , then Lean will recognize h1 h2 as a proof of  $x\in B$ .

#### Tactic State in Infoview

```
theorem Like_Example_3_4_1 (U : Type)
                                                                        case right
(A B C D : Set U) (h1 : A \subseteq B)
                                                                        U: Type
(h2 : \neg \exists (c : U), c \in C \cap D) : A \cap C \subseteq B \setminus D := by
                                                                        A B C D : Set U
  define
                                                                        h1 : A ⊆ B
  fix x : U
                                                                        h2: \neg \exists c, c \in C \cap D
                                                                        x : U
  assume h3 : x \in A \cap C
  define at h3; define
                                                                        h3: x \in A \land x \in C
                                                                        \vdash \neg x \in D
  apply And.intro
  -- Proof that x \in B:
  show x \in B from h1 h3.left
```

Note that Lean has recognized that the first goal has been achieved, so it has moved on to the second goal. This goal is a negative statement, and the given h2 is also a negative statement. This suggests using proof by contradiction, and achieving the contradiction by contradicting h2.

## Lean File

## Tactic State in Infoview

```
theorem Like_Example_3_4_1 (U : Type)
                                                                      case right
                                                                     U: Type
(A B C D : Set U) (h1 : A \subseteq B)
(h2 : \neg \exists (c : U), c \in C \cap D) : A \cap C \subseteq B \setminus D := by
                                                                     A B C D : Set U
  define
                                                                     h1 : A ⊆ B
  fix x : U
                                                                     h2: \neg\exists c, c \in C \cap D
                                                                     x : U
  assume h3 : x \in A \cap C
                                                                     h3: x \in A \land x \in C
  define at h3; define
  apply And.intro
                                                                     h4: x \in D
  -- Proof that x \in B:
                                                                     \vdash 3 c, c \in C \cap D
  show x \in B from h1 h3.left
  -- Proof that ¬x ∈ C:
  contradict h2 with h4
```

The goal is now an existential statement, and looking at h3 and h4 it is clear that the right value to plug in for c in the goal is x. The tactic apply Exists.intro x will change the goal to  $x \in C \cap D$  (we have again left off the unnecessary blank at the end of the apply tactic).

```
Tactic State in Infoview
```

```
case right
theorem Like_Example_3_4_1 (U : Type)
(A B C D : Set U) (h1 : A \subseteq B)
                                                                      U: Type
(h2 : \neg \exists (c : U), c \in C \cap D) : A \cap C \subseteq B \setminus D := by
                                                                      A B C D : Set U
  define
                                                                      h1 : A ⊆ B
  fix x : U
                                                                      h2: \neg \exists c, c \in C \cap D
                                                                      x : U
  assume h3 : x \in A \cap C
  define at h3; define
                                                                      h3: x \in A \land x \in C
  apply And.intro
                                                                      h4: x \in D
  -- Proof that x \in B:
                                                                      \vdash x \in C \cap D
  show x \in B from h1 h3.left
  -- Proof that \neg x \in C:
  contradict h2 with h4
  apply Exists.intro x
```

The define tactic would now rewrite the goal as  $x \in C$   $\wedge$   $x \in D$ , and we could prove this goal by combining h3.right and h4, using the And.intro rule. But since we know what the result of the define tactic will be, there is really no need to use it. We can just use And.intro right away to complete the proof.

#### Lean File

show x ∈ C ∩ D from And.intro h3.right h4
```

Since  $P \leftrightarrow Q$  is shorthand for  $(P \to Q) \land (Q \to P)$ , the strategies given above for conjunctions lead immediately to the following strategies for biconditionals:

## To prove a goal of the form P ↔ Q:

```
Prove P \rightarrow Q and Q \rightarrow P separately.
```

## To use a given of the form P ↔ Q:

Treat this as two separate givens:  $P \rightarrow Q$ , and  $Q \rightarrow P$ .

The methods for using these strategies in Lean are similar to those we used above for conjunctions. If we have  $h1: P \to Q$  and  $h2: Q \to P$ , then Iff.intro h1 h2 is a proof of  $P \leftrightarrow Q$ . Thus, if the goal is  $P \leftrightarrow Q$ , then the tactic apply Iff.intro \_ \_ will convert this into two separate goals,  $P \to Q$  and  $Q \to P$ . Once again, you can fill in one of these blanks if you already have a proof of either  $P \to Q$  or  $Q \to P$ , and you can leave out any blanks at the end of the tactic. If you have a given  $h: P \leftrightarrow Q$ , then h.ltr is a proof of the left-to-right direction of the biconditional,  $P \to Q$ , and h.rtl is a proof of the right-to-left direction,  $Q \to P$ .

Let's try these strategies out in an example.

#### Lean File

```
example (U : Type) (P Q : Pred U)

(h1 : \forall (x : U), P x \leftrightarrow Q x) :

(\exists (x : U), P x) \leftrightarrow \exists (x : U), Q x := by
```

## Tactic State in Infoview

```
U : Type
P Q : Pred U
h1 : ∀ (x : U), P x ↔ Q x
⊢ (∃ x, P x) ↔ ∃ x, Q x
```

The goal is a biconditional statement, so we begin with the tactic apply Iff.intro.

#### Lean File

```
example (U : Type) (P Q : Pred U)
(h1 : ∀ (x : U), P x ↔ Q x) :
(∃ (x : U), P x) ↔ ∃ (x : U), Q x := by
apply Iff.intro
```

#### Tactic State in Infoview

```
case mp
U: Type
PQ: Pred U
h1: \forall (x: U), P x \leftrightarrow Q x
\vdash (\exists x, P x) \rightarrow \exists x, Q x
case mpr
U: Type
PQ: Pred U
h1: \forall (x: U), P x \leftrightarrow Q x
\vdash (\exists x, Q x) \rightarrow \exists x, P x
```

Once again, we have two goals. (The case labels this time aren't very intuitive; "mp" stands for "modus ponens" and "mpr" stands for "modus ponens reverse".) As in HTPI, we'll label the proofs of the two goals with  $(\rightarrow)$  and  $(\leftarrow)$ , representing the two directions of the biconditional symbol  $\leftarrow$ . (You can type  $\leftarrow$  in VS Code by typing  $\label{eq:labels}$ , short for "left".) The first goal is a

conditional statement, so we assume the antecedent. In the displays below, we'll just show the tactic state for the first goal, since that's all that's relevant for figuring out our next steps.

#### Lean File

#### Tactic State in Infoview

```
example (U : Type) (P Q : Pred U)

(h1 : ∀ (x : U), P x ↔ Q x) :

(∃ (x : U), P x) ↔ ∃ (x : U), Q x := by

apply Iff.intro

-- (→)

assume h2 : ∃ (x : U), P x

case mp

U : Type

P Q : Pred U

h1 : ∀ (x : U), P x ↔ Q x

h2 : ∃ x, P x

⊢ ∃ x, Q x
```

As usual, when we have an existential given, we use it right away.

#### Lean File

```
example (U : Type) (P Q : Pred U)
(h1 : ∀ (x : U), P x ↔ Q x) :
(∃ (x : U), P x) ↔ ∃ (x : U), Q x := by
apply Iff.intro
-- (→)
assume h2 : ∃ (x : U), P x
obtain (u : U) (h3 : P u) from h2
```

#### Tactic State in Infoview

```
case mp
U : Type
P Q : Pred U
h1 : ∀ (x : U), P x ↔ Q x
h2 : ∃ x, P x
u : U
h3 : P u
⊢ ∃ x, Q x
```

Now that we have an object of type U in the tactic state, we can use h1 by applying universal instantiation.

## Lean File

```
example (U : Type) (P Q : Pred U)
(h1 : ∀ (x : U), P x ↔ Q x) :
(∃ (x : U), P x) ↔ ∃ (x : U), Q x := by
apply Iff.intro
-- (→)
assume h2 : ∃ (x : U), P x
obtain (u : U) (h3 : P u) from h2
have h4 : P u ↔ Q u := h1 u
```

## Tactic State in Infoview

```
case mp
U : Type
P Q : Pred U
h1 : ∀ (x : U), P x ↔ Q x
h2 : ∃ x, P x
u : U
h3 : P u
h4 : P u ↔ Q u
⊢ ∃ x, Q x
```

Looking at h3 and h4, we can now see that we will be able to complete the proof if we assign the value u to x in the goal. So our next step is the tactic apply Exists.intro u.

```
example (U : Type) (P Q : Pred U)
(h1 : ∀ (x : U), P x ↔ Q x) :
(∃ (x : U), P x) ↔ ∃ (x : U), Q x := by
apply Iff.intro
-- (→)
assume h2 : ∃ (x : U), P x
obtain (u : U) (h3 : P u) from h2
have h4 : P u ↔ Q u := h1 u
apply Exists.intro u
```

#### Tactic State in Infoview

```
case mp
U : Type
P Q : Pred U
h1 : ∀ (x : U), P x ↔ Q x
h2 : ∃ x, P x
u : U
h3 : P u
h4 : P u ↔ Q u
⊢ Q u
```

To complete the proof, we use the left-to-right direction of h4. We have  $h4.ltr: Pu \rightarrow Qu$  and h3: Pu, so by modus ponens, h4.ltr: h3 proves the goal Qu.

## Lean File

```
example (U : Type) (P Q : Pred U)
(h1 : ∀ (x : U), P x ↔ Q x) :
(∃ (x : U), P x) ↔ ∃ (x : U), Q x := by
apply Iff.intro
-- (→)
assume h2 : ∃ (x : U), P x
obtain (u : U) (h3 : P u) from h2
have h4 : P u ↔ Q u := h1 u
apply Exists.intro u
show Q u from h4.ltr h3
```

## Tactic State in Infoview

This completes the  $(\rightarrow)$  half of the proof; the tactic state now lists only the goal for the  $(\leftarrow)$  half. The second half of the proof is similar to the first. We begin by assuming  $h2:\exists (x:U), Qx$ , and then we use that assumption to obtain u:U and h3:Qu.

```
example (U : Type) (P Q : Pred U)
(h1 : ∀ (x : U), P x ↔ Q x) :
(∃ (x : U), P x) ↔ ∃ (x : U), Q x := by
apply Iff.intro
-- (→)
assume h2 : ∃ (x : U), P x
obtain (u : U) (h3 : P u) from h2
have h4 : P u ↔ Q u := h1 u
apply Exists.intro u
show Q u from h4.ltr h3
-- (←)
assume h2 : ∃ (x : U), Q x
```

obtain (u : U) (h3 : Q u) from h2

#### Tactic State in Infoview

```
case mpr
U : Type
P Q : Pred U
h1 : ∀ (x : U), P x ↔ Q x
h2 : ∃ x, Q x
u : U
h3 : Q u
⊢ ∃ x, P x
```

We can actually shorten the proof by packing a lot into a single step. See if you can figure out the last line of the completed proof below; we'll give an explanation after the proof.

```
example (U : Type) (P Q : Pred U)
(h1 : ∀ (x : U), P x ↔ Q x) :
(∃ (x : U), P x) ↔ ∃ (x : U), Q x := by
    apply Iff.intro
    -- (→)
    assume h2 : ∃ (x : U), P x
    obtain (u : U) (h3 : P u) from h2
    have h4 : P u ↔ Q u := h1 u
    apply Exists.intro u
    show Q u from h4.ltr h3
    -- (←)
    assume h2 : ∃ (x : U), Q x
    obtain (u : U) (h3 : Q u) from h2
    show ∃ (x : U), P x from Exists.intro u ((h1 u).rtl h3)
```

To understand the last step, start with the fact that h1 u is a proof of P u  $\leftrightarrow Q$  u. Therefore (h1 u).rtl is a proof of Q u  $\rightarrow P$  u, so by modus ponens, (h1 u).rtl h3 is a proof of P u. It follows that Exists.intro u ((h1 u).rtl h3) is a proof of A (A: U), A which was the goal.

There is one more style of reasoning that is sometimes used in proofs of biconditional statements. It is illustrated in Example 3.4.5 of HTPI. Here is that theorem, as it is presented in HTPI.

**Theorem (Example 3.4.5).** Suppose A, B, and C are sets. Then  $A \cap (B \setminus C) = (A \cap B) \setminus C$ .

*Proof.* Let x be arbitrary. Then

```
x \in A \cap (B \setminus C) \text{ iff } x \in A \land x \in B \setminus C \text{iff } x \in A \land x \in B \land x \notin C \text{iff } x \in (A \cap B) \land x \notin C \text{iff } x \in (A \cap B) \setminus C.
```

```
Thus, \forall x (x \in A \cap (B \setminus C) \leftrightarrow x \in (A \cap B) \setminus C), so A \cap (B \setminus C) = (A \cap B) \setminus C.
```

This proof is based on a fundamental principle of set theory that says that if two sets have exactly the same elements, then they are equal. This principle is called the *axiom of extensionality*, and it is what justifies the inference, in the last sentence, from  $\forall x(x \in A \cap (B \setminus C) \leftrightarrow x \in (A \cap B) \setminus C$  to  $A \cap (B \setminus C) = (A \cap B) \setminus C$ .

The heart of the proof is a string of equivalences that, taken together, establish the biconditional statement  $x \in A \cap (B \setminus C) \leftrightarrow x \in (A \cap B) \setminus C$ . One can also use this technique to prove a biconditional statement in Lean. This time we'll simply present the complete proof first, and then explain it afterwards.

```
theorem Example_3_4_5 (U : Type)

(A B C : Set U) : A ∩ (B \ C) = (A ∩ B) \ C := by

apply Set.ext

fix x : U

show x ∈ A ∩ (B \ C) ↔ x ∈ (A ∩ B) \ C from

calc

x ∈ A ∩ (B \ C) ↔ x ∈ A ∧ (x ∈ B ∧ x ∉ C) := Iff.refl _

_ ↔ (x ∈ A ∧ x ∈ B) ∧ x ∉ C := And.assoc.symm
_ ↔ x ∈ (A ∩ B) \ C := Iff.refl _
```

The name of the axiom of extensionality in Lean is Set.ext, and it is applied in the first step of the Lean proof. As usual, the apply tactic works backwards from the goal. In other words, after the first line of the proof, the goal is  $\forall$  (x : U),  $x \in A \cap (B \setminus C) \leftrightarrow x \in (A \cap B) \setminus C$ , because by Set.ext, the conclusion of the theorem would follow from this statement. The rest of the proof then proves this goal by introducing an arbitrary x of type U and then proving the biconditional by stringing together several equivalences, exactly as in the HTPI proof.

The proof of the biconditional is called a *calculational proof*, and it is introduced by the keyword calc. The calculational proof consists of a string of biconditional statements, each of which is provided with a proof. You can think of the underscore on the left-hand side of each biconditional after the first as standing for the right-hand side of the previous biconditional.

The proofs of the individual biconditionals in the calculational proof require some explanation. Lean has a large library of theorems that it knows, and you can use those theorems in your proofs. In particular, Iff.refl and And.assoc are names of theorems in Lean's library. You

can find out what any theorem says by using the Lean command #check. (Commands that ask Lean for a response generally start with the character #.) If you type #check Iff.refl in a Lean file, you will see Lean's response in the Infoview pane: Iff.refl:  $\forall$  (a: Prop), a  $\leftrightarrow$  a. So Iff.refl is the name of the theorem  $\forall$  (a: Prop), a  $\leftrightarrow$  a. (This theorem says that the biconditional has a property called *reflexivity*; we'll discuss reflexivity in Chapter 4.) Thus, by universal instantiation, for any proposition a, Iff.refl a is a proof of a  $\leftrightarrow$  a. This is used to justify the first biconditional in the calculational proof.

But wait! The first biconditional in the calculational proof is  $x \in A \cap (B \setminus C) \leftrightarrow x \in A \wedge (x \in B \land x \notin C)$ , which does not have the form  $a \leftrightarrow a$ . How can it be justified by the theorem Iff.refl? Recall that Lean doesn't need to be told to write out definitions of mathematical notation; it does that automatically. When the definitions of the set theory notation are written out, the first line of the calculational proof becomes  $x \in A \wedge (x \in B \wedge x \notin C) \leftrightarrow x \in A \wedge (x \in B \wedge x \notin C)$ , which does have the form  $a \leftrightarrow a$ , so it can be proven with the term-mode proof Iff.refl... Note that we are using an underscore here to ask Lean to figure out what to plug in for a. This saves us the trouble of writing out the full term-mode proof, which would be Iff.refl ( $x \in A \wedge (x \in B \wedge x \notin C)$ ). The lesson of this example is that the theorem Iff.refl is more powerful than it looks. Not only can we use Iff.refl \_ to prove statements of the form  $a \leftrightarrow a$ , we can also use it to prove statements of the form  $a \leftrightarrow a'$ , if a and a' reduce to the same thing when definitions are filled in. We say in this case that a and a' are definitionally equal. This explains the third line of the calculational proof, which is also justified by the proof Iff.refl

The second line uses the theorem And.assoc. If you type #check And.assoc, Lean's response is somewhat cryptic:

```
And.assoc : (?m.4075 ∧ ?m.4076) ∧ ?m.4077 ↔ ?m.4075 ∧ ?m.4076 ∧ ?m.4077
```

The explanation for this cryptic response is that And.assoc has implicit arguments, and they are not displayed by default. To see the implicit arguments, you must type #check @And.assoc. Lean's response is:

```
QAnd.assoc : \forall {a b c : Prop}, (a \land b) \land c \leftrightarrow a \land b \land c which is shorthand for
```

```
QAnd.assoc : \forall {a : Prop}, \forall {b : Prop}, \forall {c : Prop}, (a \land b) \land c \leftrightarrow a \land (b \land c)
```

This is the associative law for conjunction (see Section 1.2 of HTPI). Since a, b, and c are implicit, Lean will recognize And.assoc as a proof of any statement of the form (a  $\wedge$  b)  $\wedge$  c  $\leftrightarrow$  a  $\wedge$  (b  $\wedge$  c), where a, b, and c can be replaced with any propositions. Lean doesn't need to be told what propositions are being used as a, b, and c; it will figure that out for itself. Unfortunately, the second biconditional in the calculational proof is  $x \in A \wedge (x \in B \wedge x \notin C) \leftrightarrow (x \in A \wedge x \in B) \wedge x \notin C$ , which has the form a  $\wedge$  (b  $\wedge$  c)  $\leftrightarrow$  (a  $\wedge$  b)  $\wedge$  c, not (a

 $\land$  b)  $\land$  c  $\leftrightarrow$  a  $\land$  (b  $\land$  c). To account for this discrepancy, we use the fact that if h is a proof of any biconditional P  $\leftrightarrow$  Q, then h.symm is a proof of Q  $\leftrightarrow$  P. Thus And.assoc.symm proves the second biconditional in the calculational proof. (By the way, the HTPI proof avoids any mention of the associativity of "and" by simply leaving out parentheses in the conjunction  $x \in A \land x \in B \land x \notin C$ . As explained in Section 1.2 of HTPI, this represents an implicit use of the associativity of "and.")

You can get a better understanding of the first step of our last proof by typing #check @Set.ext. The result is

```
@Set.ext : \forall {\alpha : Type u_1} {a b : Set \alpha}, (\forall (x : \alpha), x \in a \leftrightarrow x \in b) \rightarrow a = b
```

which is shorthand for

```
@Set.ext : \forall {\alpha : Type u_1}, \forall {a : Set \alpha}, \forall {b : Set \alpha}, (\forall (x : \alpha), x \in a \leftrightarrow x \in b) \rightarrow a = b
```

Ignoring the u\_1, whose significance won't be important to us, this means that Set.ext can be used to prove any statement of the form  $(\forall (x : \alpha), x \in a \leftrightarrow x \in b) \rightarrow a = b$ , where  $\alpha$  can be replaced by any type and a and b can be replaced by any sets of objects of type  $\alpha$ . Make sure you understand how this explains the effect of the tactic apply Set.ext in the first step of our last proof. Almost all of our proofs that two sets are equal will start with apply Set.ext.
